# Contents

- Introduction
- Functions of a storm surge barrier
- Requirements and functional demands
- Types of navigable storm surge barriers
- Comparison of gate types
- Suitable gate types for New York
- Concluding remarks

# Introduction

- Netherlands: centuries of protection against floods
  - Dutch Delta Plan, water boards, dikes, levees and barriers
  - Rotterdam: City of Water, world Port, flood issue comparable to NYC
  - ARCADIS: Infrastructure, Environment, Buildings, Water
- 
- Katrina: wake up call
  - USACE New Orleans: IHNC Flood Gates Conceptual study
  - Hurricane Protection systems approach including barriers
  - Global overview of suitable gate types

# Functions of a storm surge barrier

## Primary function is storm surge protection

- Passage of ships (width, navigational depth, clearance)
- Discharge of water (wet cross section)
- Discharge of ice (free water length)
- Tidal flow (submerged sill, wet cross section)
- Passage of fish (wet cross section, flow velocity)
  
- Connection between both landsides for traffic

## Other relevant aspects:

- Maintainability
- Reliability
- Environmental impact
- Impact on landscape
- Impact on water systems
- Constructability

# Requirements and functional demands (1)

- Wet cross section for tidal flow and river discharge
- Water overtopping or leaking past the barrier
- Risk of failure (structural and closure) minimized
- Meet environmental impact criteria
- Sufficient flow & navigation during construction
- Controllable at design flow & wave conditions
- Hydraulic -, wind, ice loads
- Suitable for the required water depth & reverse head
- Flow- or wave-induced vibrations & oscillations

## Requirements and functional demands (2)

- Siltation impacts on gate operation
- Ready for operation preparation time
- Translation waves & differential head (closure)
- Sensibility for wind loads
- Vulnerability to impact of heavy objects (barges)
- Vulnerability to vandalism (terrorism)
- Clearance height & width of span for required shipping
- Accessible for inspection & maintenance
- Choice of materials and techniques for minimum maintenance

## Types of navigable storm surge gates

1. Mitre gate: double-leaf gate
2. Vertical lifting gate
3. Flap gate
4. Horizontally moving or rotating gates (including sliding and floating sector gates)
5. Vertically rotating gates (including segment and radial gates) rotating in a vertical plane about a horizontal axis
6. Inflatable rubber dams mounted to the sill

# Suitable gate types for New York (1)

- **Mitre gates and rubber dams:**
  - not suitable regarding span (>100 m) and water depth (> 10 m), resistance against currents & waves
- **Vertical lifting gates:**
  - limited width of span: connect a number of gate elements
  - clearance height for shipping: combine with a separate shipping lock or with horizontally moving gate or flap gate
- **Flap gate: could be an option though:**
  - (under water) maintenance is tough issue regarding tidal currents and sediment flows.
  - Also water depths of over 20 m might be challenge
- **Horizontally moving gates are possible, but:**
  - required space & risks of colliding ships, risk of a closure failure
  - required span for some locations
- **Vertically rotating gates are a possibility**
  - limited width of span: connect a number of gate elements
  - clearance height for shipping: combine with a separate shipping lock or with horizontally moving gate or flap gate

## Suitable gate types for New York (2)

- Not one perfect gate type for New York
- Combination of gate types, combining the most favorable aspects of several gates could result in the best solution
- Complex tidal water system requires systems approach
- Flood control solutions should be part of an integrated flood risk management system
- Flood gates should always be compared to or combined with other flood risk management measures
- Like dike or levee strengthening, natural coastal protection systems or non structural measures

## Concluding remarks

- Costs, construction time, environment, many other aspects have to be taken more into consideration
- Aspects vary with the selected gate type & with design
- No simple decision tree to find the perfect gate
- There is never just one perfect solution
- Consider combining different gate types
- An engineering systems approach is recommended
- A water systems approach is recommended
- Develop a smart water management system

**Start with a Deltaplan, like the Dutch: A Hudson Plan!!**

Thank you!
