### Smallpox Case Definition and Classification

**Clinical Case Definition:**  
An illness with acute onset of fever >101 F followed by a rash characterized by vesicles or firm pustules in the same stage of development without other apparent cause.

**Case Classification**

**Confirmed case** = A case that meets the above case definition and is laboratory confirmed.  

**Probable case** = A case that meets the clinical case definition but is not laboratory confirmed but has an epidemiological link to another confirmed or probable case.  

**Suspect case** = A case that meets the clinical case definition but is not laboratory confirmed and does not have an epidemiological link to a confirmed or probable case of smallpox. OR a case that has an atypical presentation that is not laboratory confirmed but has an epidemiological link to a confirmed or probable case of smallpox.  

Atypical presentations of smallpox include a) hemorrhagic and b) flat, velvety lesions not appearing as typical vesicles nor progressing pustules.
