Estimated Inundation (Scenario 2)

09 May 2011
@
1400 HRS

MISSISSIPPI RIVER:
Bonnet Carre flow = 100% Capacity

ATCHAFALAYA RIVER BASIN:
Simmesport flow = 760,000 cfs
Assuming Morganza flow = 0% Capacity

Assumes a gulf stage of 2 ft.

Pre-Decisional Document

DISCLAIMER:
Scenario 2 was developed as an emergency planning tool. Inundation depths reflect the highest potential inundation for a situation where interim measures constructed under emergency actions are not in place. Scenario 2 is not a prediction of performance.

It is not a hydraulic model to predict various flood depths on local communities, as no local flood fighting efforts were addressed. Effects of this scenario on flooding in the Red River backwater area is not addressed. Actual areas inundated will depend on specific flooding conditions and may differ from areas shown on the map.

Estimated Flood Depth

- 0 ft - 5 ft
- 5 ft - 10 ft
- 10 ft - 15 ft
- 15 ft - 20 ft
- 20 ft - 25 ft
- 25 ft - 30 ft
- 30 ft - 40 ft
