**Keywords:**
disaster assistance, history, legislation

**Abstract:** The evolving philosophy, activities, and responsibilities of FEMA are outlined from the first federal law to authorize funding for disaster relief enacted in 1950 to proposed legislative amendments in 1994. Originally assisting with natural disasters such as earthquakes and floods, FEMA has come to provide assistance with technological, human-made, and natural catastrophes today. FEMA’s emphasis on hazard mitigation shows a focus on consequences of disasters and emergencies. Internal agency improvements to increase federal responsiveness and efficiency are described.

**Keywords:**
Louisiana, socioeconomic impacts, Tropical Storm Allison

**Abstract:** The study focuses on the impact of Tropical Storm Allison of June 2001 in Louisiana. One-hundred forty-nine households in Slidell participated in a survey designed to assess the impacts of the storm, vulnerability, and coping and adaptation modes of the population. More than 50 percent of the sample consisted of repeat flood victims and 58 percent of the surveyed households reported moderate to severe damage from Tropical Storm Allison to their homes. Nearly 28 percent of households suffered monetary losses over $20,000. Among precautions taken by respondents, obtaining flood insurance was the major measure reported by the majority of respondents. While there was no statistically significant difference by race on impact of flood damages, major racial and socioeconomic differences were found for access to resources, emergency relief, source of relief, flood insurance policy, and elevation. The report highlights the need for local governments to review building permit processes, consider risk factors present in their community, assess the vulnerability of their community to flooding, increase expenditure on infrastructure improvements, educate homeowners of the benefits of flood insurance, and for FEMA to provide flood insurance subsidies to homeowners, especially those with lower incomes.

**Keywords:**
Alabama, Community Rating System, compliance, development, enforcement, federal programs, Flood Mitigation Assistance Program, floodplain management, Hazard Mitigation Grant Program, mapping, mitigation, NFIP, substantial damage, substantial improvement, variances

**Abstract:** This guidebook is intended to aid local building, planning, zoning, and code enforcement officials engaged in enforcement of the NFIP through explanations and examples of the NFIP’s requirements. The guidance outlines the minimum requirements for participating in the NFIP and offers recommendations for optional higher standards. Additionally, the handbook
gives information specifically related to floodplain management in Alabama. Chapter topics include flood hazard maps, standards for floodplain development, permit issuance, inspection, enforcement and compliance, variances, roles and responsibilities of local officials, suggestions for improving floodplain management and an introduction to related programs and objectives. Related programs and objectives include the Community Rating System (CRS), Flood Mitigation Assistance (FMA) Program, the Clean Water Act, and open space preservation. Appendices include technical information, state and federal contact information, and a glossary of terms.

**Keywords:** building codes, compliance, enforcement, Hurricane Hugo, hurricanes, insurance coverage, insurance industry, mitigation

**Abstract:** Hurricane Hugo brought into focus a need to examine how states, municipalities, building code officials, builders, architects, and insurers might work together to lessen damage from hurricanes. This study reports on the increase in people and property at risk from hurricanes along the Gulf and Atlantic Coasts. It also reviews evidence on how the strength of local building codes and the level of compliance have made a difference in the amount of damage sustained in recent hurricanes. The report analyzes the wide variations in building codes in effect along the Gulf and Atlantic Coasts, and highlights states and organizations that have paid special attention to wind resistance requirements in building codes. Cost implications of stronger wind resistance requirements for construction of new homes are explored. Finally, the study contains a summary of comments made by coastal building officials and inspectors about the challenges of improving enforcement of and compliance with wind resistance provisions in building codes. One major finding indicates that property values exposed to hurricane losses along the Atlantic and Gulf Coasts increased 64 percent from 1980 to 1988.

**Keywords:** legislation, mitigation, Stafford Act

**Abstract:** On October 30, 2000, President Clinton signed H.R. 707, the Disaster Mitigation and Cost Reduction Act, into law (P.L. 106-390). The law amends the Robert T. Stafford Disaster Relief and Emergency Assistance Act to require that states submit a detailed, comprehensive state program for emergency and disaster mitigation prior to receiving funds from FEMA. The law requires FEMA to hold a public comment period before adopting new or modified policies that may result in a meaningful change in the amount of assistance a state or local community may receive.

**Keywords:** legislation, mitigation, Stafford Act
Abstract: This document reviews the recent legislation relating to natural hazards mitigation. It focuses on the legislative bottleneck that precluded new legislation from amending the Stafford Act. Two flood-related exceptions to the bottleneck were a disaster mitigation pilot program within the Small Business Administration and a law requiring states to submit detailed, comprehensive state programs for emergency disaster and relief before receiving funds from FEMA.

Keywords: building codes, floodplain management, International Code Series

Abstract: This guide (produced in cooperation with International Code Council, Building Officials and Code Administrators International, International Conference of Building Officials, Southern Building Code Congress International, Inc., Association of State Floodplain Managers, and the American Society of Civil Engineers) is to help community officials decide how to integrate the 2000 edition of the International Codes (I-Codes™) for building safety into their current floodplain development and regulatory processes. The I-Codes™ contain provisions that meet the minimum flood resistant design and construction requirements of the NFIP. The guide neither endorses any specific approach nor does it explain the NFIP requirements and how to administer them. Chapter 1 includes an overview of the NFIP, community and state responsibilities under the NFIP, the benefits of participation in the NFIP, and the implications of not participating. Chapter 2 reviews approaches to floodplain management, noting that integrating a community's approach with the I-Codes™ involves planning to reduce overlap of regulations, duplications of effort, and conflicts. Worksheets are provided to help communities assess how their current approaches to regulating development compare to the NFIP’s requirements and to facilitate decisions. Chapter 3 discusses the implications of adopting the I-Codes™ in terms of development other than buildings and structures, on-site utility systems, NFIP’s Community Rating System, building code amendments for consideration by communities that choose higher standards, requirements for handling substantial improvement and repair of substantial damage, and the provision of Increased Cost of Compliance coverage for substantially damaged buildings. Chapter 4 reviews community responsibilities under the NFIP, including record keeping, permits, notification requirements, flood hazard map-related duties, elevation certificates, inspections, enforcement and violations, and the variance process.

Keywords: communication, marketing, NFIP

Abstract: The National Flood Insurance Act of 1968 provides for subsidized flood-insurance and seeks to reduce long-term flood damage through land-use and other control measures. The floods of 1972 and 1973 provided early tests of the program, and it appears to have been deficient in many respects. The author examines these deficiencies and offers reasons for their existence. Ameliorative actions that were taken and others that have been proposed to improve the program are analyzed. Finally, the lessons learned from this study are used to postulate
guidelines for improving existing and future government-industry programs. These guidelines include the use of modern marketing techniques, adequate incentives for salesmen, commitment from management, and measuring demand for the product.

Keywords: insurance

Abstract: This publication reviews the basic principles for insurance as it relates to catastrophe insurance. The author concludes that the current systems for insurance and compensating property damages caused by natural disasters, including floods, are flawed by endemic problems. The severity of the problems has grown over 25 years in conjunction with increasing catastrophe-related property damage. A review of the problems (increased frequency and severity of events, rapid population of properties in high risk areas) and recommendations for new/alternative approaches are described, including a return to fundamental insurance principals.

Keywords: hydrology and hydraulics, Italy, modeling, risk assessment

Abstract: This paper describes an integrated hydrological and hydraulic modeling approach for the risk assessment of a flood-prone area and its application to analyzing the effects of extreme flood events on the Montalto di Castro thermoelectric power plant. The approach is based on four major steps. The first step entails a detailed analysis of available critical events as well the collection of hydro-meteorological and cartographic data to perform a statistical evaluation of extreme rainfall events and an estimation of the probable maximum precipitation (PMP). The second step involves the calibration of a rainfall-runoff model for the upper catchment area based on the data observed during a recent flood event. The third step involves the calibration of a two-dimensional hydraulic model for simulating floodplain inundation using the previously reconstructed runoff and a comparison of the results with the maximum flood levels observed during the same event. The final step concerns the simulation by the two-dimensional hydraulic model of the flood wave obtained via the rainfall-runoff model using the extreme and PMP values of rain redefined in the first step. The results of this approach appear to be extremely useful and easily transferable to other areas.

Keywords: coastal areas, cost-benefit analysis, erosion, property values

Abstract: The article presents an investment decision model for problems associated with shoreline erosion. The model determines the economic benefits that a landowner can realize from available alternative protection structures. Benefits are estimated from erosion-induced property value decline for specific reaches of shoreline. This approach enables the decision-maker to determine the local economic impact of alternative shore land management policies. The
economic effects of coastal management policies, such as nonstructural shore land protection, wetlands regulation, and public beaches, are discussed in terms of the model's ability to evaluate and compare the opportunity cost of alternative policies. Finally, the article presents and discusses computational examples of the model output.

**Keywords:**
California, disaster assistance, Florida, insurance industry, insurance premiums, NFIP

**Abstract:** Although the number of deaths and injuries due to natural disasters has declined in recent years, the number of people affected by these phenomena has increased. In light of the increasing financial costs of natural disasters, the private insurance industry has become increasingly skittish about insuring against them. This article identifies and evaluates the ways that state and federal governments can provide disaster relief and insurance against natural disasters. With regard to the NFIP, the author notes that private insurance companies face enormous difficulties providing insurance against flood damage. He notes the NFIP’s achievements in floodplain management; the development of FIRMs for at-risk communities, the increase in the participation of at-risk communities and the home mortgage industry, and the development of an efficient rate structure of flood insurance premiums.

**Keywords:**
insurance coverage, insurance industry, structural approaches, United Kingdom

**Abstract:** The report examines the role of government and the insurance industry in protecting individuals from flooding flood losses in the United Kingdom. The report also provides recommendations for improving floodplain management in the short, medium, and long term. In the short run, the insurance industry has committed to a two-year agreement to continue to make flood insurance available to existing residential properties and small businesses. The government has repaired flood defenses in the United Kingdom to enable them to withstand floods equivalent to the flood risk in that area. In the medium and long term, the insurance industry wishes to return to a market-based system of flood insurance in which the insurance industry is somewhat protected from losses by the government’s flood defense measures. The report recommends that the insurance industry should work with the government to determine where floodplain development and changes in land use could increase the demand for flood insurance coverage in areas that do not currently require it. Insurers are currently working with the government to assist policy holders in managing their own risk, either by properly insuring against damage or by taking steps to reduce their vulnerability to flood damage. The government ought to supplement these efforts by curtailing floodplain development and increasing investment in flood defenses.

**Keywords:**
development, England, floodplain designation, floodplain management, nonstructural approaches
Abstract: The document describes government policy on the role of land-use planning to reduce risks from flooding and encourage local planning authorities to take flood risk into consideration in the planning of developments. Approximately 8 percent of the total area of land in England is at risk from river flooding, affecting about 10 percent of the population and 12 percent of the agricultural land. The document recognizes that a sustainable approach to floodplain management involves avoiding additional development in some areas and utilizing an appropriate level of protection when development is necessary. Developers should expect to demonstrate that there are no reasonable options in lower-risk areas, when siting flood prone development. In England, there is no statutory responsibility for the government to protect land or property against flooding. However, government has permissive power to act in the public interest. Government policy is derived from policy issued by the Department for Environment, Food and Rural Affairs and the Environment Agency. The document also addresses the role of regional planning authorities, local councils, and developer contributions in decreasing flood risk.

Keywords: alluvial fans, Arizona, California, insurance claims, insurance coverage, mapping, mitigation, mudflows, Nevada, Oregon, risk assessment

Abstract: This report summarizes the papers and discussions of a workshop to investigate approaches for improving the effectiveness of floodplain management in alluvial fan, mudflow, and mud flood areas. Participants in the workshop agreed that problems caused by alluvial fans and mud floods in the fast-growing areas of the West and Southwest were too serious to delay new initiatives until the completion of methodological research and the development of detailed maps. Reasonable actions including encouragement of local and state governments to exceed minimum NFIP standards, improved performance standards for land use, and increases in rates for flood insurance can and should be under consideration. Additional research to perfect methods of assessing risk and techniques of mitigating hazards should take place simultaneously. FEMA should provide leadership in such efforts, but other federal agencies should also contribute technical assistance and knowledge. Participants also recommend the encouragement of state and local governments to assume enhanced roles.

Keywords: alluvial fans, coastal areas, dams, erosion, development, ice jams, levees, mitigation, mudflows, risk assessment, risk management, subsidence

Abstract: This document provides guidance to local officials in their efforts to reduce flood losses in areas of high risk. It is designed to identify general areas where special risks are posed to life and property due to the depth, velocity, and duration of flooding, debris in the water or other factors; describe a process for amending existing regulations or adopting new regulations for areas of high risk; and provide examples of innovative local programs and approaches for areas of high risk. Chapter 1 gives an overview of nine types of areas of high risk: areas behind
unsafe or inadequate levees, areas below unsafe or inadequate dams, coastal flooding and erosion areas, flash flood areas, subsidence and liquefaction, fluctuating lake levels, ice jams, and mudslides. Chapter 2 explains the importance of managing areas of high risk and describes general options and steps for improving their management. Chapters 3 through 11 provide description and guidance for managing development in areas of high risk. The appendices contain examples of ordinances, regulations, guidelines, and descriptions of local programs.

**Keywords:** marketing

**Abstract:** This report is the result of a survey of ASFPM membership to determine what is being done to promote the sale of flood insurance and recommend guidelines based on the responses. The majority of respondents cited flood threats as the primary basis for promoting the sale of flood insurance. Slightly less than half of the respondents used a campaign approach to increase public participation.

**Keywords:** communication

**Abstract:** The purpose of this survey is to evaluate the distribution of data on insurance policies from FIA to the states. The survey was initiated partly in response to complaints about the timeliness of communication between states and FIA. The survey asked state NFIP coordinators about the frequency and format of information they receive. Fifty-two percent of the responding states felt that they were not receiving the information on a regular basis and 80 percent felt that the information was necessary to the operation of the state NFIP program.

**Keywords:** disaster assistance, disaster planning, federal programs, flood disaster planning, floodplain management, mitigation

**Abstract:** This guide provides a point-by-point discussion on how elected officials should prepare for and recover from flooding in their communities. Successful preparation for a flood should involve understanding the local flood problem and floodplain and building support by promoting floodplain management. After a flood has occurred, a community has a number of resources at its disposal. Elected officials should know how to access those resources for the benefit of the community. The guide also includes a checklist of measures for addressing a community’s flood problems and information on mitigation and sources of outside assistance.

Coast to Coast: 20 Years of Progress is divided into 12 parts: national policy and programs; multihazard mitigation; multi-use watercourses; local planning and management for flood mitigation, coastal hazard mitigation, hydrology and hydraulics; modeling and computer programs; mapping; precipitation, gauging, forecasting, and warning; stormwater management; construction techniques, building, performance, and data collection; and planning for, using, and maintaining structures for loss reduction. Relevant contributions to this anthology include: (a) Michael Davis’ “New Directions for the Corps of Engineers Water Resources Programs,” which emphasizes the need for both developing strong partnerships with state and local governments and supporting nonstructural approaches to mitigation; (b) Shirley Mattingly’s “Mitigation and Partnerships for Floodplain Management,” which states that the creation of the Flood Mitigation Assistance Program will lead the way for the creation of a pre-disaster mitigation program; (c) Bernard Scheff and Kenneth Nacci’s “Floodplain Management in Urban Redevelopment: A Case Study in Multiple Objective Management,” which presents the flood control project at Arcadia Creek as a case study to show how multiple objectives of urban development could be effectively achieved; (d) David Knowles and Peter Richardson’s “The Zone A Crunch,” which highlights the increasing demand for better mapping, particularly with increased enforcement of mandatory purchase by banks; (e) William Weaver’s “Urban Stormwater Regulations: A Worthy Opponent to Development-Induced Flooding,” which concludes that since the late 1970s, urban regulations have been important in reducing the impact of urbanization on flood conditions; and (f) Frank Thomas’ summary of the conference. Thomas identifies the inherent policy conflicts between land-use and mitigation and emphasizes the need to build closer working relationships within a multigovernmental, multihazard, and multidisciplinary framework.

Abstract: This report provides a complete national summary of the practice of floodplain management at the state and local levels. Most of the information presented in this report was obtained through a questionnaire mailed to the NFIP coordinator in each of the 50 states, the District of Columbia, Guam, Puerto Rico, and the Virgin Islands. Supplemental information was obtained from various federal, state, local, and private resources, and other published material. The report begins with a discussion of the roles played by the state and local levels of government, then describes some broad activities they undertake. The middle part of the report is organized around the Unified National Program’s framework of strategies and tools. The last chapter summarizes the changes in the field over the last three years (or more, when earlier comparable data are available) and notes both statewide and national trends.

**Keywords:**

cost-benefit analysis, floodplain management, mitigation, substantial damage

**Abstract:** This report comments on the use of cost-benefit analyses for the elevation of substantially damaged buildings with FEMA funds. In 1996, FEMA issued a policy memorandum waiving the requirement for a cost-benefit analysis in the acquisition of substantially damaged buildings, except in coastal areas. ASFPM solicited comments on the issue from federal, state, local, and private-sector floodplain managers. Arguments in favor of requiring a cost-benefit analysis focus on the position that limited mitigation funding can be put to better use than in projects that do not provide an equitable return in damage prevented. Supporters of waiving the requirement for a cost-benefit analysis cite a variety of efficiency and consistency issues. According to the NFIP, elevating substantially damaged buildings proves cost-effective in a majority of cases. However, some respondents believe devoting resources to cost-benefit analyses on a project-by-project basis wastes resources, interferes with other planning considerations, and probably has minimal impact on projects.

**Keywords:**

Army Corps of Engineers, coastal areas, floodplain management, Hurricane Fran, hydrology and hydraulics, mapping geographic information systems, mitigation, public policy

**Abstract:** *Floodplain Management in a Multifaceted World* is divided into 13 parts: national policy and programs; state and local planning and management for flood mitigation; watershed management; coastal issues; lessons from Hurricane Fran; hydrology and hydraulics; mapping; using structures for loss reduction; using geographic information systems; protecting and using floodplain resources; evaluating environmental projects, international approaches; and the practice of floodplain management. James Lee Witt, Director of FEMA, summarizes the agency’s initiatives, in particular those involving buyouts, mapping, and communication. He also announces an ASFPM-FEMA cooperative project to develop an academic fellowship for floodplain management. Michael Davis, Deputy Assistant Secretary of the Army for Planning, Policy, and Legislation, concludes that integrated policies are possible and that the choice between flood protection and environmental protection does not have to be made. Dennis Mileti argues that the traditional perspective in dealing with natural disasters has flaws because it focuses on a hazard-by-hazard approach. He defends a more holistic view of hazards. Gilbert White argues that the next challenge for floodplain management is to find ways to create a fresh approach to floodplain management by incorporating the whole range of concepts. Robinson et al. present the Army Corps of Engineers’ new cost-effectiveness and incremental-cost analysis software called ECO-EASY. Hansen et al. discuss the research on environmental planning at the Corps of Engineers. They point out that the Corps initiated the Evaluation of Environmental Investments Research Program (EEIRP) in 1993 to provide Corps planners with methods and techniques to develop feasible projects under a limited budget.

**Keywords:**
Alabama, Colorado, Delaware, Flood Mitigation Assistance Program, Georgia, Hazard Mitigation Grant Program, Illinois, Maryland, Minnesota, Missouri, mitigation, Montana, North Dakota, South Dakota, Wyoming

**Abstract:** Local, state and federal floodplain managers and emergency managers constantly work to reduce or eliminate the effects of natural hazards in communities nationwide. Efforts to achieve and implement mitigation techniques, approaches, and successes have been actively underway in the United States for over two decades. The Hazard Mitigation Grant Program (HMGP) and the Flood Mitigation Assistance (FMA) Program represent the primary funding sources for many of the projects described in this report. In addition to presenting examples of activities to mitigate the effects of natural hazards, the report publicizes the benefits of mitigation successes across the nation. These examples should serve as models for future projects and provide decision-makers with valuable information about how to formulate, undertake, and ultimately achieve natural hazard reduction at the local level.

Available for purchase at: [http://www.floods.org/PDF/PUBSLIST.pdf](http://www.floods.org/PDF/PUBSLIST.pdf)

**Keywords:**
compliance, enforcement, environmental policy, federal programs, floodplain management, geographic information systems, hydrology and hydraulics, insurance, modeling, mapping, mitigation, urban areas

**Abstract:** *Planning Ahead: Reducing Flood Losses in the 21st Century* is divided into 13 parts: local projects and programs for planning, mitigation, acquisition, and recovery; watershed management; protecting and restoring natural and cultural resources in floodplains; community assistance for the NFIP; techniques and projects in stormwater management; hydrologic forecasting; flood modeling, GIS and simulations; flood hazard mapping; special flood-related hazards; international approaches to floodplain management; flood insurance; and federal programs, policies, and initiatives. Relevant contributions include: (a) Peterson et al.’s “Reducing Flood Losses Through Floodprone Land Acquisition: Identifying Total Costs and Benefits,” which analyzes the flood-prone land acquisition program (FLAP) initiated by Pima County, AZ, in 1984 to offer property owners, who had either lost their homes or sustained severe damage, the option of selling their property to the County rather than rebuilding at the same location (although the County later expanded the program to include the acquisition of underdeveloped properties and parcels in upper watershed areas); (b) Burrell Montz and Graham Tobin’s “The Effectiveness of the NFIP in Two Communities: Syracuse, NY, and Tampa, FL,” which obtains a preliminary view of the impact of the NFIP on the development of urban floodplains; (c) Mark Boyer’s “Coming Full Circle: Using the NFIP to Prevent At-Risk Development in Flood-Prone Lands,” which argues that the NFIP may well represent the best mechanism for achieving no new building in areas prone to flooding; and (d) Michael Scheffler’s “Flood Risk Assessment and Mitigation - An Insurance Company’s Approach,” which suggests
that floodplain managers need to ally with and draw on the insurance industry’s network of loss-control engineers. The author believes insurers, floodplain managers, and the public need access to the organized data sets used in FEMA’s studies of flood hydrology and hydraulics. Scheffler also considers it essential to reverse cutbacks on funding in the U.S. Geological Survey’s streamgage program, which provides critical data to quantify and direct changes in flood risk.

buyouts, coastal areas, Community Rating System, compliance, enforcement, environmental policy, erosion, floodplain management, geographic information systems, hydrology and hydraulics, mapping, mitigation, modeling, public policy, substantial damage, training

Abstract: This conference report is divided into 14 parts: national policy and programs; state and local planning, management, and projects for flood mitigation; applying GPS, GIS, and other technology; coastal issues; mapping: program issues, applications, and new technology; acquisition; stream protection and restoration; flood damage estimation; post-flood activities; building performance and standards; program and policy evaluations and issues; professional activity in floodplain management; stormwater management and watershed management; and hydrology and hydraulics. Relevant contributions to this anthology include: (a) Michael Armstrong’s “Thirty Years of the National Flood Insurance Program,” which discusses the program’s accomplishments, challenges, and opportunities; (b) David A. Stroud’s “The NFIP’s Community Rating System: A Proactive Approach to Mitigation Planning,” which describes the process of planning as a component of participating in CRS; (c) Sue Hoegberg’s “FEMA’s New Digital Flood Insurance Rate Map Data Plans,” which explains FEMA’s proposal to create two new types of DFIRM to meet the needs of floodplain management; (d) Miriam G. Anderson et al.’s “A New Urban Revival: Floodplain Acquisition in Lawrence, Massachusetts,” which outlines a project to acquire and demolish flood-prone structures in a densely developed, post-industrial city; (e) Marshall Mabry et al.’s “Local Floodplain Administrator Training During Post-Flood Recovery,” which summarizes efforts to train local floodplain administrators for work in the post-disaster environment; and (f) Rose Austin et al.’s “Community Profiling of the National Flood Insurance Program: A Quantitative Analysis of Local Programs,” which gives the details of a study undertaken by FEMA to assess the ability of local communities to administer and enforce the requirements of the NFIP by interviewing local floodplain managers. FEMA records the responses and uses them to develop a profile of the community.

Alabama, Colorado, Connecticut, Delaware, Flood Mitigation Assistance Program, Georgia, Hazard Mitigation Grant Program, Illinois, Maryland, Minnesota, Mississippi, Missouri, mitigation, Montana, North Dakota, Pennsylvania, South Dakota, Texas, Utah, Wyoming

Abstract: One of the primary goals of local, state, and federal floodplain managers and emergency managers is to reduce or eliminate the effects of natural hazards such as flooding, hurricanes, tornadoes, winter storms, wildfires, etc. in communities nationwide. The third edition of this report profiles 40 projects from 17 states in order to publicize the benefits of hazard mitigation. Each profile describes project benefits, costs, and funding sources.

Keywords:
Abstract: This study examines national floodplain management policies and programs and identifies improvements that would help secure sustainable floodplain lands and disaster-resilient communities for the future. The study identifies five areas in which ASFPM will focus over the next several years: (a) fostering responsibility and capability at the individual, local, and state levels; (b) refining policies, programs, and coordination to build on existing strengths and remedy deficiencies; (c) assembling and improving the data and tools that are vital to wise floodplain management; (d) enhancing education, training, and public awareness; and (e) assessing and evaluating programs so that the appropriate lessons can be learned from them.

Keywords: floodplain management, history

Abstract: This document examines the forces and events that have shaped floodplain management policy and practice. One major result of past influences was the merging of flood control, disaster assistance, and resource protection programs. Future concerns lay in needed policy changes suggested by a number of floodplain and natural hazard response assessments conducted during the 1990s. Floods continue to teach us about the need for fundamental policy changes in disaster response, recovery, and mitigation and for long-term floodplain management. Because policy changes during the last decades of the twentieth century were largely the result of agency initiatives, the outlook for significant congressional actions going into the twenty-first century are not promising for either providing overall direction on national flood policy or in coordinating federal programs and policies.

Abstract: *Breaking the Cycle of Repetitive Flood Loss* is divided into nine parts: analysis and aftermath of specific storms; flood hazard mapping; applications of new technology to floodplain management; flood forecasting and warning; hydrology and hydraulics; damage assessment, damage estimation, and risk analysis; modeling and its applications to floodplain management; floodplain management in practice; state and local projects and programs for flood hazard mitigation. Relevant contributions to this anthology include: (a) Nathan H. Foged’s “State of California Awareness Floodplain Mapping,” which explains a program that will identify and map flood hazards not already mapped by FEMA; (b) Donald W. Armour, Jr. and Cindy Crecelius’s “Statewide Floodplain GIS for Ohio,” which provides an overview of a Floodplain Management Geographic Information Management System (Floodplain GIMS) to manage selected information on flood hazards in Ohio; (c) John S. Grounds, III et al.’s “A Field Guide for Conducting Damage Assessments of Flooded Residential Structures,” which describes a pilot
program in Houston and Harris County, TX, to assess damaged structures in the post-flood environment; (d) Eric Simmons and Edward Curtis’s “Encouraging North Carolina Communities to Adopt Safer Floodplain Management Standards,” which recommends how local officials can develop safer practices for development in the floodplain; (e) Gale William Fraser and Betty Hollister’s “The Growing Importance of Communication in Floodplain Management,” which emphasizes the importance of educating the public on the issues of flood safety and floodplain management; and (f) Adrienne Sheldon’s “Community Assistance Visits in West Virginia,” which discusses regulatory issues identified during 12 CAVs conducted in 2000.

Keywords: community associations, history, floodplain management

Abstract: This document traces the history of the Association of State Floodplain Managers (ASFPM), beginning in 1982. At that time, ASFPM was an organization with roughly 150 state floodplain managers from 48 states. They were starting to draw the attention of federal agencies involved in floodplain management, mapping, and insurance, such as the U.S. Army Corps of Engineers, U.S. Geological Survey, and National Weather Service. In 1982, Arizona formed the first state floodplain management association. Currently, there are 25 state and regional floodplain management associations, covering 33 states with almost 4,500 members. ASFPM supports state associations by distributing its newsletter, News and Views; attending state association meetings; providing opportunities for education, technical assistance, and accreditation programs; supporting education of federal, state, and local policymakers and the general public about flood risk reduction. The relationship between ASFPM and state associations is symbiotic: both provide support for one another through a variety of activities that aim to reduce flood losses. The report recognizes that the day-to-day implementation of floodplain management occurs in the 20,000 communities participating in the NFIP. Only a handful of communities are sufficiently wealthy and conscientious to send floodplain managers to ASFPM conferences and training. State floodplain management associations can fill the gap by educating and supporting local floodplain managers. The document provides detailed summaries of the histories, accomplishments, and goals of each state floodplain management association.

Abstract: For over two decades, mitigation activities have been implemented across the country to save lives, reduce property damage, and lessen the need for recovery funding. In many cases, mitigation success has been achieved following devastating disasters, when local officials and
the general public have realized the need to effect change in their community. The fourth edition of this report profiles projects from 39 communities in 24 states in order to publicize the benefits of hazard mitigation. Each profile describes project benefits, costs, and funding sources.

**Abstract:** *New Trends in Floodplain Management, 2001* is divided into 11 parts: protecting natural floodplain resources; special flood-related hazards; watershed management; techniques and projects in stormwater management; structural measures for flood hazard management; hydrology and hydraulics; applying GPS, GIS, and other technology; flood hazard mapping; national programs, policies, and initiatives; state, local, and regional programs and projects for flood mitigation; and partnerships for mitigation, disaster resilience, and sustainability. Relevant contributions to this anthology include: (a) Christopher Jones et al.’s “Consideration of a New Flood Hazard Zone: The Coastal A Zone,” which provides evidence to support design and construction requirements in coastal A Zones more similar to those of V Zones than to those of riverine A Zones; (b) Duke G. Altman’s “Balancing River Restoration Planning and Flood Control Requirements—San Antonio River in San Antonio, Texas,” which explains an innovative and progressive design to restore a section of the San Antonio River; (c) Eric Berman et al.’s “Digital CAV (DCAV) Data Collection Tool,” which describes new software to assist state officials in performing CAVs; (d) Edward Laatsch and Rebecca Quinn’s “The International Code Series: Issues Related to NFIP Participation,” which discusses how communities have the opportunity to use the adoption of the I-Codes™ for their NFIP provisions; (e) Ross Richardson et al.’s “Implementation of the FEMA Repetitive Loss Strategy in Louisiana,” which outlines a proactive strategy to address repetitive loss structures in Louisiana; and (f) Robert Sullivan and Mable Soong’s “The Hazard Mitigation Grant Program: Overview and New Trends Towards an Improved Local and State Mitigation Tool,” which summarizes efforts by FEMA and states to streamline the administration of HMGP.

**Keywords:**
floodplain management
Available at: [http://www.floods.org](http://www.floods.org)

**Abstract:** The report begins with a discussion of the roles played by the state and local levels of government. The second main section describes the underlying structures of state floodplain management: state and local authority, budgets, staffing, and details about program management and coordination. Each of the next five sections examines one of the actual activities the state (and local) programs carry out in their efforts to minimize flood losses: managing development; protecting natural functions and resources of floodplains; mitigation, providing information; and
mapping. The concluding chapter summarizes some changes in the field over the last seven years and notes both statewide and nationwide trends.

**Keywords:**
1 percent annual chance flood standard

**Abstract:** The document presents a series of articles on the 1 percent annual chance flood standard. The articles are meant to serve as background information for the September 2004 Assembly of the Gilbert F. White National Flood Policy Forum. The forum served as a discussion group and kick-off for a substudy of the Evaluation of the NFIP. The main topics were the history and use of the standard, tools and tech for mapping and risk analysis, the implementation of the standard, and its societal implications. The authors were primarily FEMA officials, academics, and floodplain management professionals.

**Keywords:**
economic modeling, insurance purchase decision, risk assessment

**Abstract:** A detailed theoretical model characterizing the individual’s decision to purchase flood insurance is specified and the magnitude of the risk parameter is estimated using data based on transactions of flood insurance purchases. Empirical results for several samples of this subset of the general population indicated that consumers exhibited a relatively uniform degree of risk aversion across various localities where different hydrologic and economic conditions prevailed. More specifically, results indicate that the individual’s demand for insurance becomes more price inelastic and shifts to the right as the risk parameter value increases. While the estimates presented should not be directly extrapolated to the entire population located in a flood prone area, they provide evidence that parameters determining an individual’s and/or community’s willingness to pay for flood protection can be measured.

**Keywords:**
Hurricane Andrew, Hurricane Hugo, Hurricane Iniki, hurricanes, wind

**Abstract:** This paper describes potential hurricane hazards from wind and water. Damage to residential structures from three recent intense hurricanes—Hugo, Andrew, and Iniki—shows that wind is responsible for greater property loss than water. The economic cost of the damages caused by these hurricanes is reported.

Army Corps of Engineers, flood damage

Abstract: This report offers the Army Corps of Engineers’ assessment of the economic consequences of residential flood damage. USACE estimates residential structure and content values and damages and the associated uncertainty parameters in order to estimate damages from floods and the benefits of flood-damage reduction projects. USACE developed its Corps of Engineers Floodplain Inventory Tool (CEFIT) for organizing floodplain inventory data and estimating residential structure and content damage for various depths of flooding on a structure-by-structure basis. Information related to structure and content depth-damage relationships at the component level is not available from historical records, prediction methods, or literature review. Expert-opinion elicitation provides a means of gaining information on these essential risk-related quantities. This report describes the different components of the expert-opinion elicitation process, outlines the process itself, and documents the results.

Babcock, Marion and Bruce Mitchell. Impact of flood hazard on residential property values in Galt (Cambridge), Ontario. Water Resources Bulletin, 16(3), 532-7. Keywords:

attitudes, housing markets, Ontario, property values, risk perception, urban areas,

Abstract: This study is an examination of the relationship between flooding and property values for an urban community in southwestern Ontario, which has a lengthy history of flooding. Peoples’ perceptions of the effect of flooding on property values are discussed. Analysis of sales prices and assessment data demonstrated no statistically significant differences in values of property for residences located in high- and low-risk areas. Sales prices after the 1974 flood were significantly higher than sale prices before the flood. The perceived property values followed a similar pattern. The analysis concludes that differences in flood risk and flood experience do not adversely affect actual or perceived long-term property values.

Barnard, Jerald R. (1978). Externalities from urban growth: The case of increased storm runoff and flooding. Land Economics, 54(3), 298-314. Keywords:

development, hydrology and hydraulics, modeling, urban areas

Abstract: This paper is concerned with the problem of increased frequency and magnitude of flooding from urban growth and its impact on urban residential property. The research involves a joint hydrologic and economic investigation into urban growth in small watersheds. Additionally, the paper adds to the list of negative externalities linked with urban growth, namely the increased flood hazard that can develop in a small watershed due to urban growth. Results indicate that an externality and income-distribution effect arise from urban expansion in a small watershed. The hydrologic evidence shows that as urban expansion spreads further into the upper portions of the watershed, the probability of flooding downstream properties is increased. The analysis of property values indicates that the property market has recognized the effect of flood hazard, and property owners in the lower part of the watershed have suffered a relative decline in property values.

Keywords: floodplain management, France, public policy, structural approaches

Abstract: The presentation begins by arguing that increased damages due to flooding are sustainable for property owners, businesses, governments, and insurance companies. Demand for flood insurance is conducted on an individual basis, with little or no solidarity or learning process. In a worst case scenario, high premiums lead to property owners dropping their policies, which leads to too little money for flood insurance companies, which leads to higher premiums. On the supply side, tax-funded infrastructure can lead to the illusion of protection. The typical reaction of governments to more damages is to introduce more infrastructure, which can lead to greater overconfidence among floodplain residents. A possible solution is to treat water as a common property and to combine land-use controls and regulatory tools to reduce vulnerability. Also, a super-fund based on a tax on insurance premiums establishes common protection against catastrophes, but with a learning mechanism. France has a system like this, in which five types of natural disasters are covered by a superfund. Insurance companies have not able to raise insurance rates on victim’s premiums because the disaster is “exceptional.” Communities are required to map hazard zones and enforce land-use regulations. In the 20-year history of the system, the French have found that it is difficult to decide what a real disaster is. Thus an increasing number of events are covered, sometimes repeatedly. The initial 6 percent tax on insurance premiums had to be raised to 12 percent. In the short term, the system performs well, but the lack of a learning process hinders its long-term effectiveness. The report concludes by discussing current and long-term limitations to France’s approach to floodplain management.

Keywords: flood damage, South Carolina, Georgetown County

Abstract: A recent state assessment of repetitive flood losses in South Carolina indicated that Georgetown County has the greatest amount of monetary flood losses in the Southeastern United States, totaling almost $40 million from March 1978 to September 1999. Preliminary analysis suggests that while the coastal location of the county is a major determining factor, other coastal counties with much higher population and housing densities have significantly lower documented flood losses. The purpose of this research is to determine the etiology of flood losses within Georgetown County and to identify particular areas within the county that have the greatest flood losses. In order to determine what causes these high losses, a detailed study of communities within the county provides insight into characteristics that encourage flood losses. This study analyzes historic flood loss data, insurance and mitigation information, the number of properties within the community and in each flood zone, and the location of each property using statistical techniques and GIS. The conclusions will become a valuable tool for planners and emergency managers to direct physical and monetary resources toward the communities experiencing the greatest amount of losses.

**Keywords:**
attitudes, awareness, compliance, floodplain management, Oregon, risk perception, Texas

**Abstract:** This working paper contains two studies: “Adoption of the Federal Flood Insurance Program in Two Texas Communities” and “The Problems and Issues of Implementing the National Flood Insurance Act in Oregon.” The first study analyzes the local power structure in the decision to adopt floodplain regulations in New Braunfels and Sequin, TX. Based on surveys and interviews with various stakeholders, the author finds that proposals for regulating the floodplain seem to encounter general public apathy, although they may produce conflict with the local power structure. Furthermore, the perception of respondents to the risk of flooding and their evaluation of the consequences of floodplain regulations varied considerably. However, as the author notes, public officials in the two communities lacked a well-defined approach to promoting floodplain management and its consequences to citizens. The second study assesses the issues and problems of implementing the National Flood Insurance Act (the Act) in Oregon and seeks to determine, through surveying, the impact of the Act’s land-use regulations and the attitudes of occupants of the floodplain towards insurance. Based on the assessment, the Act had greater impact at the local level than at the state level of government. Six counties and five cities in the state adopted regulations to participate in the NFIP. Over 50 percent of these local governments would not have instituted regulations, as least not as soon as they did, had it not been for the assistance provided to victims of floods by the NFIP. Furthermore, a survey administered to residents of the floodplain in Lane County, OR, revealed that 59 percent favored restricting development within the 1 percent annual chance floodplain to open space and agriculture. Only 36 percent of respondents knew of the availability of flood insurance.

**Keywords:**
disaster assistance, federal programs, legislation, Stafford Act

**Abstract:** FEMA was established in 1978 by President Jimmy Carter and consolidated the emergency management and preparedness functions of various federal agencies. The agency is responsible for a broad range of statutory authorities and falls within the jurisdiction of a number of congressional committees and their subcommittees. FEMA administers the principal federal disaster relief authority, the Robert T. Stafford Disaster Relief and Emergency Assistance Act. While authorized disaster relief funds have traditionally been appropriated with little debate, a funding shortfall occurred in 1991. Action was taken to prevent recurrence of a shortfall.

Available at: [http://www.ncseonline.org/nle/crsreports/risk/rsk-37.cfm?&CFID=16724038&CFTOKEN=63387721](http://www.ncseonline.org/nle/crsreports/risk/rsk-37.cfm?&CFID=16724038&CFTOKEN=63387721)

**Keywords:**
development, floodplain management, legislation

**Abstract:** The author argues that the Clinton Administration’s initiative to shift federal emergency management policy away from an emphasis on response and recovery generated little congressional controversy, although some raised concerns about the cost effectiveness of
implementing a mitigation strategy. Greater attention, it is generally argued, should be given to mitigation (loss reduction) efforts before disasters occur in order to reduce future losses. Some future disasters may be prevented, or their impact lessened, by taking action beforehand. State and local governments have lowered disaster costs by retrofitting buildings in earthquake zones, elevating structures in floodplains, revising and enforcing building codes, or modifying land use plans. Advocates of the legislation seek to support these and other mitigation efforts.

**Keywords:** economic modeling, flood damage, modeling

**Abstract:** In the National Research Council’s report, *Flood Risk Management and the American River Basin—An Evaluation*, the use of expected probability (accounting for sampling uncertainty) in estimating flood frequencies and average annual flood damages, as practiced by the Army Corps of Engineers, was said to be biased. Alternative procedures recommended in the report are based on studies of samples drawn from a Gaussian population with a fixed damage function. There is no extension of the study to diverse populations (many flood locations) with different flow-damage functions, but conclusions drawn are that the recommended procedures provide frequency and damage estimates that are nearly unbiased. Beard demonstrates that expected-probability procedures used by the Army Corps of Engineers are appropriate for flood-frequency estimation and for estimation of average annual flood damages.

**Keywords:** environmental restoration, Midwest floods of 1993, Missouri River

**Abstract:** This article examines efforts to return the Missouri River to a more natural state in the late 1990s. It discusses the importance of the river’s floodplains to the ecology of the river, balancing the economic and commercial needs of people along the river with environmental concerns, the percentage of the river’s native fish and wildlife species, which are on federal and state protection lists, the Missouri River Basin Association, and how the 1993 flood has impacted efforts to aid the floodplains.

**Keywords:** coastal areas, development, subsidies

**Abstract:** The author complains that despite geological evidence that the edge of the sea is an imprudent place to build houses, development along the Atlantic coastline is increasing. Many shore communities are inaccessible to the public yet rely on public funds for flood insurance, shore protection, post-storm cleanup, and restoration of houses damaged by coastal storms. The author concludes that if individuals were forced to bear more of the cost of shoreline living, homebuyers might think twice before deciding to build expensive homes on the coast.

Keywords:
Australia, disaster planning, mitigation

Abstract: The report documents regional flooding associated with Tropical Cyclone May in the Gulf of Carpentaria in late February and early March 1998 and assesses residential and commercial preparation, local government response action, and state government assistance. Few homes were inundated with floodwaters, but major roads were closed and remained impassable for up to four weeks, isolating several townships. Communities and homes were generally unprepared for the isolation, which was compounded by the failure of septic tank systems, disruptions to fresh water supplies, and garbage disposal and landfill problems. Local government provided effective response action, but lacked mitigation and planning components. The report concludes that some of the economic loss could have been avoided if effective mitigation strategies had been initiated.

Available at: [http://www.iahr.org/newsweb/bdy_flooddisaster.htm](http://www.iahr.org/newsweb/bdy_flooddisaster.htm)

Keywords: Economic impacts, public policy

Abstract: Flood disasters account for about a third of all natural catastrophes throughout the world (by number and economic losses) and are responsible for more than half of the fatalities. Trend analyses reveal that major flood disasters and the losses generated by them have increased drastically in recent years. Cooperation between the state, the affected population, and the insurance industry assumes a key role with regard to the flood hazard. Scientists, engineers, and insurers must work together in formulating their requirements and shaping them in such a way that politicians can derive clearly recognizable policy options (e.g., land-use restrictions) from them. Another important aspect is stepping up the efforts being made towards curbing climate change, which might otherwise exacerbate the risk situation in the future.

Keywords: Australia, cost-benefit analysis, development, economic modeling, geographic information systems, modeling, risk assessment

Abstract: The article presents a GIS-based flood damage model used by the Gold Coast City Council to determine the benefits of proposed flood mitigation measures and assess proposed floodplain development. The model integrates a property database, a floor-level survey database, a topographical digital elevation model, floor surface digital elevations models, and stage damage relationships for differing dwelling types. Using these components, the model analyzes existing data and estimates the property damage to a specific area given a certain set of flood conditions. Despite a number of limitations, the model has successfully assessed the flooding impact of development proposals and flood mitigation options for the community.

**Keywords:**
flood control, Netherlands

**Abstract:** During the last several years, residential and commercial development of once unoccupied floodplains has increased significantly in the Netherlands. The development has prompted Dutch authorities to reconsider and revise their approaches to flood management. This article deals with several aspects of the floods that occurred in 1993 and 1995 and outlines the formal system of disaster management in the Netherlands. Finally, an overview is provided of the events that occurred during both floods with special emphasis on warning and evacuation. Important lessons drawn from Dutch flood management include: adoption of rules concerning entrance into an abandoned, flooded area; development of procedures for the evacuation of livestock; understanding of the economic consequences to agriculture, business, and industry; knowledge of how the government awards post-disaster aid; and the communication of flood-related information to the public. Furthermore, the authors cite the self-regulating behavior of the Dutch people as one of the most critical factors to their success with flood management.

**Keywords:**
Alabama, economic modeling, housing markets, property values

**Abstract:** This study tests the hypothesis that homes located in floodplains have lower property values. Data came from 93 home sales in Homewood, AL, of which 39 were from homes located within the 1 percent annual chance floodplain. Control variables included square feet of heated area, finished basement, age of house, number of bedrooms, number of bathrooms, fireplace, car storage, and time on market. The housing market appears relatively homogenous because selling prices ranged from $48,000 to $90,000 and because all the homes had locations in the same school district. The authors fit the data with a stepwise-linear regression model. According to the regression model, a property’s location in the floodplain does not have statistical significance. The authors conclude that while floodplain location does not influence property values in Homewood, appraisers of real estate should not generalize these results but rather conduct similar analyses for each housing market.

**Keywords:**
England, modeling

**Abstract:** Hydrological time series are often asymmetric in time, insomuch as rises are more rapid than recessions, as well as having highly skewed marginal distributions. A two-stage transformation is proposed for deseasonalized series. Rises are stretched and recessions are squashed until the series is symmetric over time. An autoregressive moving average (ARMA) model is then fitted to the natural logarithms of this new series. A double mixture of Weibull and exponential distributions represent the residuals from the ARMA model. The method is
demonstrated with 24 years of daily flows from the River Cherwell in the south of England and a 40-year record from the upper reaches of the Thames. The article gives seasonal estimates of flood risk and these can be conditioned on catchment wetness at the time of prediction.

**Keywords:** economic modeling, North Carolina, property values, wetlands

**Abstract:** This study uses hedonic property price approach to estimate how wetlands affect nearby residential property values. Two general categories of wetlands are recognized – coastal and inland. A hedonic price function is estimated using wetland inventory data coupled with extensive property sales records in Carteret County, NC. Results indicate that proximity to coastal wetlands has a positive association with the nearby property value, while inland wetlands lower the value in a neighborhood. Reducing the distance to the nearest coastal wetland by 1,000 feet raises the property price by $1,010 at the initial distance of one mile, while the same change for inland wetlands decreases the property price by $567. In addition, this study utilizes a semi-parametric method in selecting an appropriate hedonic price functional form.

**Available:** http://www.ecu.edu/econ/wp/03/ecu0306.pdf#search='Evidence%20Before%20and%20After%20Hurricane%20Floyd'

**Keywords:** floodplain, North Carolina, property values, wetlands, economic modeling

**Abstract:** This study uses a hedonic property price function to estimate the effects of flood hazards on residential property values. The study utilizes data from over 8,000 single-family residential home sales in Pitt County, North Carolina between 1992 and 2002. This area experienced significant flooding from Hurricane Floyd in September 1999. Results show that a house located within a floodplain has a lower market value than an equivalent house located outside the floodplain. Furthermore, the price discount from locating within a floodplain is significantly larger after Hurricane Floyd than before. For an average valued house, the price discount for floodplain location is greater than the capitalized flood insurance premiums for sales after Floyd but less than capitalized flood insurance premiums for sales before Floyd.

**Keywords:** development, economic modeling, environmental policy, floodplain management, housing markets, insurance, mandatory purchase, Minnesota, NFIP, public policy, property values, risk perception, zoning

**Abstract:** This research aims to develop models of single-family housing and land markets to determine the nature of benefits from economic efficiency and distributional implications of improved information on flood hazard and floodplain development regulations introduced by the NFIP and to empirically test the model in a case study of Rochester, MN. A gain in economic
efficiency is demonstrated when improved information on flood hazard can allow a household to make better decisions in planning housing purchase and investment, consumption, and saving over a lifetime. On the supply side, gains in economic efficiency are expressed as a socially optimum expansion of new construction in the flood-free zone, and contraction in the flood hazard zone. Accompanying these gains are distributional impacts for owners of properties in the floodplain (negative impact on property values) and outside the floodplain (positive impact) after the release of information on flood hazard. Pecuniary gains and losses of factors in the home construction and development industry can reduce the ability of the housing market to adjust to changes in consumer demand. The empirical model for Rochester did not significantly estimate the social value of flood hazard information or the distributional impacts of the NFIP on owners of existing homes and undeveloped residential land. The policy implications of the theoretical model and empirical tests conclude the analysis.

Keywords: attitudes, awareness, compliance, disaster assistance, insurance, insurance coverage, insurance industry, insurance purchase decision, lending institutions, mandatory purchase, marketing, Nevada, NFIP, public policy, risk communication, risk perception

Abstract: Though the NFIP has been in existence since the late 1960s, only a quarter of those eligible have purchased policies to reduce the effects of flooding. The study uses the 1997 New Year’s Day flood in Reno, Nevada to investigate why single-family homeowners purchase flood insurance. The flood caused $200 million in property damage to over 1,400 homes and businesses, as well as two deaths. Although 54 percent of respondents in the study area reported some level of damage from the flood, only 52 percent of residents in the SFHA had purchased flood insurance following the disaster. Lender compliance, personal perceptions of vulnerability to floods, concern for the adequacy of government assistance, and concern that flooding was a constant threat were the most significant variables in the insurance purchase decision. The authors question whether the Reform Act’s attempts to move responsibility for insuring from individuals to lending institutions will in fact increase flood damages by further reducing the homeowner’s sense of personal responsibility to minimize their own flood risk.

Keywords: natural disasters, socioeconomic impacts

Abstract: While much research attention has been focused on understanding and interpreting social movements that emerge in response to technological hazards, comparatively little work has been directed toward the systematic examination of factors related to protest activity in the aftermath of natural hazards. The authors study community activism after a major flood mitigation project failed to provide the promised protection from storm water damage. They conclude that citizen response to natural events is becoming far less distinct from that witnessed in the aftermath of man-made events, because the technology to mitigate impacts of natural disasters is becoming more available. The results of the study show that solidarity is a necessary
ingredient for social movement facilitation, particularly when the movement is loosely structured and urgently organized, and that the presence of solidarity aids in the communication of grievances, recruitment of members, and the coordination of activities.

**Blong, Russell. (2004).** *Estimating Residential Flood Damage.* Macquarie University, New South Wales, Australia: Natural Hazards Research Centre.

**Keywords:**
Australia, economic impacts, modeling

**Abstract:** The report tests the Natural Hazards Research Centre (NHRC) Contents and Building loss estimation curves for residential property and examines their deficiencies. The existing NHRC Contents curve is based on potential, rather than actual losses. Testing indicates that the curve is likely to underestimate insured losses. The NHRC Building curve needs refinement for such issues as damage due to floodwater velocity and losses external to the structure. The combined NHRC Contents and Building curve produce higher loss estimates and indicate that insured flood losses are higher than suggested and that the benefits of floodplain management have been understated. The report recommends further development and testing of flood loss estimation curves and average annual damage estimates.

**Keywords:**
lending institutions, mandatory purchase

**Abstract:** The Federal Reserve System has supervisory responsibility for approximately 1,000 state member banks (SMBs). During the review period of July 1, 1997 to June, 30, 1999, the Federal Reserve System conducted 697 examinations of SMBs for compliance with the flood insurance provisions of Regulation H (12 CFR 208). Thirty-nine SMBs were examined twice during the reporting period. The frequency of examinations for compliance with consumer regulations, including the flood insurance requirements, is based on the size of an institution and its history of compliance. Of the SMBs examined during the 1997-99 reporting period, 223 had violations of at least one section of the flood insurance provisions of Regulation H. The three most commonly cited violations reported by the examiners included the required use of the Standard Flood Hazard Determination form, the requirement to purchase flood insurance where available, and the notice of special flood hazards and availability of federal disaster relief. Generally, the violations of the flood insurance requirements of Regulation H appear to be isolated or technical and not indicative of any pervasive patterns of noncompliance.

**Keywords:**
Arizona, Colorado, development, floodplain management, Georgia, Illinois, Missouri, Nebraska, New Jersey, North Dakota, Ohio, Oklahoma.

**Abstract:** The author examines the extent to which floodplain management programs influence the investment and predevelopment decisions of owners of vacant floodplain land in 10 cities: Arvada, CO; Cape Girardeau, MO; Fargo, ND; Omaha, NE; Palatine, IL; Savannah, GA; Scottsdale, AZ; Toledo, OH; Tulsa, OK; and Wayne, NJ. He discusses the role of landowners in
the urban floodplain market, land acquisition, holding vacant land, the influence of local floodplain policy on land holding, property value expectations, and as targets of public policy.

**Keywords:**
development, floodplain management, risk perception, riverine areas

**Abstract:** This article examines the degree to which riverine floodplain management affects purchase and mitigation decisions by owners of developed floodplain property. Based on a survey of 105 floodplain property owners in 10 U.S. cities with floodplain management programs, the authors find that the stringency of such policies does not lessen the purchase of properties in floodplain because of the overriding importance of site amenity factors. Indeed, flood protection measures incorporated into development projects appear to add to the attractiveness of floodplain location by increasing the perceived safety from the hazard. Property owners’ responses to a flood hazard after occupancy involve political action more often than individual on-site mitigation. It is suggested that floodplain programs will be more effective in meeting their objectives if they are directed at intervention points earlier in the land conversion process.

**Keywords:**
Economic impacts, methodology, South Africa

**Abstract:** The report calculates flood damage to a plant in the Vereeniging floodplain in South Africa using combined estimates of the damages to four components; plant and equipment, raw materials, completed goods, and structure. The method of combined damage estimates is used because the research found that it is not possible to develop standard flood-damage functions for industries. Too many differences exist between and within industries to create accurate flood-damage curves. The paper reviews methodologies for the calculation of industrial flood damage. In the example of the Vereeniging flood, the authors estimated direct and indirect damage to the four industrial components. Indirect damages included the cost of business interruption and the effect of flood damage on long-term market share.

**Keywords:**
NFIP, strategic planning

**Abstract:** From March through August 2000, FIA developed a strategic *Blueprint for the Future for the NFIP* through a series of leadership workshops attended by members of the FIA Executive Committee and through independent data gathering and analysis. This report incorporates the results of the workshops and supplemental analysis and includes a discussion of program mission, customer and stakeholder analysis, program vision, future scenarios, impediments to achieving strategy, goals and objectives, action plans, implementation guidance,
and next steps. NFIP’s Program Vision for the next five years is threefold: (a) a program that efficiently delivers insurance products that are accessible, desired, and seamlessly provided to its customers and partners; (b) a program where communities not only meet, but exceed NFIP’s floodplain management standards; and (c) a program that is financially sound both as an agent of change and as a long-term insurance solution.

Keywords: disaster assistance, Florida, public assistance, South Carolina

Abstract: The article criticizes the implementation and consequences of FEMA’s evacuation efforts during Hurricane Floyd in 1999. The author focuses on the experiences of residents in Florida and South Carolina, which were predicted to bear the brunt of the storm before it veered north. His contention is that the actions of state and federal government officials in these two states were more disruptive than the hurricane itself. First, President Clinton declared federal emergencies in several states before the hurricane touched the continental United States. This action prompted the issuance of mandatory evacuation orders to nearly three million residents. Some drivers were trapped in traffic jams with no movement for 12 hours. State officials exacerbated the mass exodus by delaying opening eastbound lanes of major interstates to coastal evacuation traffic. Anecdotal interviews found residents who vowed not to evacuate their homes, preferring to face the hurricane than the traffic jams. The cost of the evacuation was estimated at $2 billion, borne almost entirely by evacuees. Second, the declaration of federal emergencies prompted state officials to seek compensation. The federal government covered 75 percent of overtime pay for police, firefighters, and other government workers in Florida, which suffered little damage. State officials had incentives to escalate spending in the expectation that Washington would cover costs. The author finds these practices especially troublesome in light of the federal government’s contribution to coastal and low-lying development through the NFIP and other programs. Disaster assistance to rebuild homes and reconstruct infrastructure undermines efforts to discourage unwise development.

Keywords: agriculture, Big Black River, economic modeling, Mississippi, property values

Abstract: The primary purpose of this study was to determine the impact of flooding on the value of land in the Big Black River basin. Economic rent theory was extended and modified to explain how flooding influences land values. Two theoretical components of the overall effect of flooding were identified. First, flooding tends to cause shifts in land use to endeavors that yield lower returns. Second, flooding tends to increase production costs. The combined effect is to reduce realized earnings, thereby reducing land values. In order to obtain empirical estimates of these effects, sales price and other characteristics were ascertained for two independent samples of transfers, one flood-prone and one not subject to flooding. Regression analysis was used to develop a model to explain variation in transfer prices for each of the two samples. Different variables were important in explaining price variation, and there were significant differences in the coefficients of some variables between the two regressions. Additional regression analysis
conducted on the flood-prone sample suggested that flooding that causes crop damage results in a reduction in value of $28 per acre or approximately 13 percent.

Keywords: insurance purchase decision, risk perception

Abstract: This study provides strategies for targeting efforts to increase flood insurance policies for FEMA and the NFIP. The research specifically addresses the effect of household income on the decision to purchase flood insurance. The study concluded that individuals with higher incomes are more likely to purchase flood insurance than those with lower incomes. One of the consequence of this finding is that in comparison to homeowners, renters, who tend have lower incomes, and less education, are less likely to buy flood insurance. Renters were also found to be less informed about their flood coverage status: only 10 percent of renters indicated that they believed they have flood insurance coverage.

Keywords: flood awareness, Cover America, marketing

Abstract: This report reviews all of Bozell’s efforts involving the Cover America campaigns and their work with the NFIP. The report summarizes all aspects of the Cover America and Cover America II campaigns, including types of advertising, the markets that were targeted, and when the ads ran. Bozell then presents the campaign results for the various types of media utilized and by each year of the campaigns. The overall results of the campaign show that both awareness and favorable opinions of flood insurance and the NFIP increased by 4 percentage points for each year of the campaigns.

NOTE: This report was in draft form at the time of its inclusion in this bibliography. Consequently, FEMA had not yet provided comments necessary for Bozell and KRC Research and Consulting to produce a final version.

Keywords: Cover America, marketing

Abstract: This report was prepared as an evaluation of the Cover America campaign, which ran from October 1995 to March 1999. The campaign incorporated television, radio, and print advertising, as well as direct mailings and public relations efforts such as media tours and articles, to increase knowledge about floods and flood insurance and to help generate sales of policies. The report outlines the entire campaign by area of advertising and presents the methodology and results for determining the campaign’s success. The report shows that the campaign was successful in increasing the awareness and favorability of FEMA and of the NFIP and outlines which methods were the most efficient way to reach potential buyers and agents.

Keywords:
economic impacts, floodplain management, insurance premiums

Abstract: This report evaluates the NFIP’s economic effects on property owners, the federal government, and the private insurance industry. The report finds that flood insurance is a more equitable and efficient way to cope with flood risks than relief programs and recommends using flood insurance premiums to finance grants and low-interest loans for temporary relief following flood disasters. Impediments to the purchase of flood insurance, namely the transaction costs that arise from selling flood insurance as a separate policy, could be reduced by bundling flood insurance with the traditional homeowner’s policy. With respect to floodplain management, the report endorses elevating structures to the point where benefits from reduced flood losses exceed the costs of raising the structure by the maximum amount, rather than the 1 percent annual chance flood level. The report advocates increased partnership with the private insurance industry and the elimination of government subsidies for reinsurance premiums. The proper role of the federal government should be to underwrite catastrophic risks, provide hydrological information, and subsidize premiums for existing homes.

Keywords:
insurance coverage, insurance purchase decision, risk communication

Abstract: Flood damages that occur worldwide remain largely uninsured losses despite the efforts of governmental programs that often provide insurance available at less than fair market cost. The current study focuses on the financial experience of the NFIP from 1983 through 1993 to examine the hypothetical determinants of decisions to purchase flood insurance. The same set of factors is important for both individuals and businesses—price, probability of loss, and amount of loss. Additionally, there is a negative relationship between the amount of money the federal government spends on mitigation and both the number of policies purchased and the amount of insurance purchased. At the state level, purchase of flood insurance correlates highly with the level of flood losses during the previous year.

Keywords:
Australia, insurance coverage, insurance industry

Abstract: The paper details the proceedings of a 2001 meeting that reexamined Australia’s lack of comprehensive flood insurance and seeks to determine whether this adversely affected residents, and if so, what a potential solution might be. Issues from a prior meeting of the Centre for Resource and Environmental Studies in 1989 remained largely unresolved and there was considerable disagreement among insurance and floodplain management professionals regarding the potential costs and benefits of flood insurance. There was concern about adverse selection, the high cost of premiums, discouragement of flood mitigation activities, and even the definition of a flood. Based on research in other countries, the paper presents a pessimistic view of
homeowners’ knowledge of flood risks and willingness to purchase insurance. The meeting’s participants agreed that insurance premiums might be reasonable, depending on the definition of risk. The paper recommends a balanced approach to flood insurance by private industry and government. Because of a longstanding political ideology that the government should avoid intervention in matters that can be left to the private sector, a flood insurance program solely sponsored by the government is unlikely. However, there is still a role for government in flood insurance, namely providing the overarching legislation for the insurance industry, providing the framework of goals, producing maps, and intervening when outcomes are not fair and transparent for consumers.

Keywords: economic impacts, environmental impacts, floodplain management, methodology, public policy, socioeconomic impacts

Abstract: This report takes a first step in the development of an improved capacity for evaluating the effectiveness of floodplain management and land use. It presents a conceptual framework for considering the context, role, objectives, components, and impacts of floodplain management. It discusses issues involved in measuring program effectiveness and develops an approach to explain why the impacts and effectiveness of programs to measure land use vary from one community to another. The research reported here is one part of a larger study of floodplain management. In addition to the development of this conceptual framework, other objectives of the research include: 1) determination of the state of floodplain management as it is practiced in the United States, 2) development of operational measures of effectiveness and a methodology for focusing them on monitoring and evaluating local floodplain management, and 3) an assessment of the proposed measures and methods based on field-level trial applications in three communities.

Keywords: development, floodplain management

Abstract: The authors surveyed 1,203 local political jurisdictions to measure their activities in floodplain management. The authors found that communities with the greatest exposure to the NFIP tend to have adopted the broadest, most stringent local programs. Yet, these very communities were often the ones that had allowed more development of floodplains in the past. The authors also found that the NFIP was not effective in slowing growth in the floodplains, partly because the communities that were experiencing the greatest growth were also inclined to join the program, causing adverse selection, which makes the paradox of the program apparent.

Keywords: floodplain management
Abstract: This book concentrates on floodplain management as a component of broader urban programs to control floods that might also include structural measures, floodproofing of existing buildings, participation in the NFIP, preferential tax treatment, density transfers, and public information programs. A major finding of the study is that management of land use in floodplains is most effective in communities that use a number of the aforementioned flood control instruments and in which the goal of flood control is integrated with other public objectives such as recreation, preservation of open space, and the protection of natural areas.

Keywords: floodplain management, marketing

Abstract: This report identifies important research for improving the productivity of floodplain managers in state and local government. The report represents the input of individuals and organizations that work directly with floodplain management policies. A list of 145 research needs was generated by asking members of the Association of State Floodplain Managers, “What do you need to know to do a better job of floodplain management?” The report approaches the task of improving the productivity of floodplain management as a product development and marketing problem, focusing on how best to persuade various groups to adopt a product or practice. In this case, the groups are individuals, local and state governments, and firms, and the products or practices are uses, or non-uses, for flood hazard areas. The report recommends specific research needs in the areas of background information, implementation, and program planning, management, and evaluation, as well as changes in federal policy.

Keywords: flood damage, floodplain management

Abstract: The authors studied the efforts of 10 cities to manage land use in floodplains and conclude that floodplain management has significantly reduced annual flood damage (a saving of $11 million per year in reduced losses). However, the authors believe that the NFIP, by making floodplain structures safer through building standards and flood control works and more financially secure through flood insurance, seems designed to stimulate rather than hinder consumers’ willingness to locate in floodplains.

Keywords: floodplain management

Abstract: This article acknowledges the progress in research on the management of floodplains but laments the gaps in what needs to be known to manage floodplains effectively. State and
local floodplain managers, in particular, will have to develop more sophisticated tools for building the private sector’s commitment to and capacity for accomplishing flood-loss reduction. The major gaps that are highlighted include: (a) research on the effect of floodplain management on development decision making in the private sector and on the ultimate impacts of public policy on economic, social, and environmental well-being; (b) research on cost-effective programs that motivate individuals and firms to reduce risk to existing developments; (c) research on the impact of nonstructural flood-hazard mitigation programs on various accounts; and (d) research to identify the effects of existing floodplain management programs on communities’ economic, social, and environmental well-being and to develop usable policy analysis tools for local decision makers.

Keywords:
floodplain management, hazard identification, mitigation, NFIP

Abstract: To deal with the rising exposure to flood losses, the federal government provides flood insurance through the NFIP. The NFIP has three key elements: identification of flood hazard areas and risk; mitigation of flood losses through mandated local regulation of construction in floodplains; and provision of flood insurance. Evidence to date suggests that while its accomplishments are notable, in many respects the program has fallen short when measured against its primary objectives. Flood hazard identification is incomplete. Mitigation has failed to contain increasing exposure to property damage in floods and coastal storms. And, market penetration of flood insurance may be low, in spite of the availability of subsidized insurance rates for two-thirds of the buildings located in flood-hazard areas. These conclusions, however, are based on circumstantial evidence and need to be evaluated through systematic study.

Keywords:
agency operations and management, floodplain management, hazard identification, insurance, insurance premiums, insurance purchase decision, mandatory purchase, mitigation, NFIP, public policy, Special Flood Hazard Areas, subsidies

Abstract: With over six million buildings located within the boundaries of the 1 percent annual chance floodplain, flood losses are ubiquitous. To address damages, the federal government provides residential flood insurance through the NFIP. In this article the author describes the U.S. approach to flood insurance and notes what he believes to be a number of problems that have limited the program’s effectiveness. In the author’s estimation, these include that flood hazard identification is incomplete and methods used to determine flood zones are flawed. Also, he opines that mitigation has failed to contain or reduce exposure to property damage in floods and coastal storms or markedly reduce exposure to loss of existing buildings located in flood hazard areas. Market penetration of flood insurance is low, in spite of mandatory purchase requirements for new construction and the availability of subsidized insurance rates for two-thirds of the buildings located in flood hazard areas. The experience of the United States with the provision of flood insurance, while not without obstacles, offers a number of useful lessons for other nations considering government-sponsored flood insurance programs.

Keywords:
floodplain management, riverine areas, development

Abstract: The authors compared changes in floodplain development between 1976 and 1985 in 10 cities and concluded that the NFIP and the floodplain management regulations it has fostered in communities across the United States are having a measurable effect in reducing new development in riverine flood hazard areas.

Keywords:
natural disasters, public policy

Abstract: This book summarizes the results of an extensive study of public losses from natural disasters during the 1980s and how those losses can be controlled through reforms in federal, state, and local policy. The study, initiated in 1986, considered its objective to provide a carefully conducted study that documents the magnitude and character of public losses in over 130 natural disasters, describes a range of policy options for dealing with those losses, and evaluates opportunities for and constraints on innovation and reform in this policy arena. The study uses data from federal records to investigate local losses due to natural disasters, a case study of the Whittier Narrows earthquake (October 1987) to demonstrate the wide variation in losses nearby governments experience in a large, Presidentially declared disaster, and several surveys to evaluate the impact of federal policies on local governments’ adoption of protective measures.

Keywords:
compliance, development, enforcement

Abstract: Shortfalls in compliance have been found in a number of recent reviews of development and environmental programs. In this article, the authors examine critical choices planning administrators face if they are to improve compliance. They also offer suggestions about what can be done to ensure that regulations, once adopted, are subsequently followed by contractors, builders, and developers. Based on data collected from a national sample of cities and counties, the article finds that improving compliance is not simply a matter of enhancing capacity for detecting and correcting violations. It shows that improving compliance also requires an increase in the private sector’s willingness to comply with regulations voluntarily. The means for affecting this result include making greater use of incentives and employing facilitative enforcement techniques.

**Keywords:**
Hurricane Katrina, disasters, public policy, hazard mitigation, building codes

**Abstract:** The unprecedented losses from Hurricane Katrina can be explained by two paradoxes: the safe development paradox is that in trying to make hazardous areas safer the federal government has in fact substantially increased the potential for catastrophic property damages and economic loss. The local government paradox is that while their citizens bear the brunt of human suffering and financial loss in disasters, local officials pay insufficient attention to policies to limit vulnerability. This article demonstrates that in spite of the two paradoxes disaster losses can be blunted if local governments prepare comprehensive plans that pay attention to hazard mitigation. The federal government can take steps to increase local government commitment to planning and hazard mitigation by making relatively small adjustments to the Disaster Mitigation Act of 2000 and the Flood Insurance Act. However, to be more certain of achieving a reduction in disaster losses, a major reorientation of the National Flood Insurance Program from insuring individuals to insuring communities is likely to be needed.

**Keywords:**
Australia, cost-benefit analysis, mitigation, nonstructural approaches, structural approaches

**Abstract:** Floods have accounted for 29 percent of the total natural disaster costs in Australia over the past 30 years. This report examines the costs, benefits, and performance of flood mitigation measures (e.g., structural and nonstructural options) in Australia to develop a series of case studies. The case studies aid in the construction of a more complete picture on the benefits realized through Australian flood mitigation projects. To a lesser degree, the report discusses and quantifies where possible, social and environmental considerations. A number of findings specific to the cases studies are presented in addition to more universal conclusions including, but not limited to: the importance of considering flood mitigation options that address all three sources of risk—existing, future, and continuing; the importance of community awareness and preparedness together with reliable and timely flood warning systems; and the importance of tailoring mitigation solutions to the uniqueness of each community. The availability and reliability of data and the capture and quantification of indirect and intangible costs and benefits limited some parts of the analysis.

**Keywords:**
mapping, modeling

**Abstract:** Components contributing to uncertainty in the location of the fringe of a mapped floodplain are identified and examined to determine their relative importance. First-order uncertainty analysis is used to provide a procedure for quantifying the magnitude of uncertainty
in the location of the fringe. Application of the procedure indicated that one standard deviation of uncertainty in floodplain inundation width is about one-third of the mean computed inundation width for several population-flood geometry combinations. Suggested mapping criteria, which directly incorporate uncertainty estimates, are given. While these criteria are more suitable for use in developing areas than in floodplains that have had extensive development, the analysis procedure can be used to accommodate property owners who challenge the validity of estimated flood fringe boundaries. Use of uncertainty analysis in floodplain mapping should enhance the credibility of the final plan.

Keywords: hydrology and hydraulics, mapping, 1 percent annual chance flood standard

Abstract: This report describes and compares the probable standard errors of estimate in terms of national average for three different methods that have been used recently by the USGS to define flood-boundary elevations for 25-, 50-, and 1 percent annual chance flood discharges in natural channels. The methods scrutinized by the author to determine the 1 percent annual chance flood-boundary elevations include detailed, historical, and physiographic. In addition to describing the implementation of each method, the author also considers their limitations and accuracy. Based on the analyses and using 3.9 m as a national average for the 100-yr flood depth, the detailed method has a probable standard error of 23 percent (0.9 m), the historical method 23 percent (0.9 m), and the physiographic method 27 percent (1.1 m). The article also concludes that the detailed method has applicability to a wide range of hydraulic and topographic conditions, the historical method has similar applicability but only with the availability of specific data, and the physiographic method has the simplest applicability of the methods used.

Keywords: awareness, Canada, disaster planning, Manitoba, Red River, risk communication, risk perception

Abstract: The author examines issues that affect an individual’s perceptions of risk associated with national hazards in the context of the 1997 flood of the Red River in Manitoba, Canada. Information about risk perception came from 10 public meetings held by the Manitoba Water Commission to review actions taken during the flood. The response to the flood event varied between and within various locations in the Red River Valley. Flood damages were limited in areas that were adequately prepared for the flood, where there was good support from local government, and where recent experiences from the 1996 flood were relevant. Areas that experienced widespread flood damage were those that were unable to prepare in time because of misleading experience in 1996 and poor forecasts, or newly flooded areas that lacked relevant flood experience and received limited warning and minimal support from the local government. The greatest success occurred where planning for the flood started early. The paper concludes that warnings of flood events should be tailored to the experiences of the individuals in different areas since the unique experiences of the individuals will lead to different responses. However, because experience is a complex factor, there are limits to the benefits that can be derived from previous experience. Two recommendations are made: (a) the experience of individuals and local government officials should be used to revise and update the emergency flood response plan for
an area and (b) public education immediately following a major flood event can increase awareness of flood risks and the importance of developing and following an emergency plan.

**Keywords:**
California, compliance, elevation certificates, enforcement, floodplain management

**Abstract:** This handbook accompanies a workshop on elevation certificates taught by the California Department of Water Resources (DWR) to local floodplain administrators. In the handbook, DWR emphasizes the three purposes of an elevation certificate: to properly rate a flood insurance policy, to determine compliance with NFIP regulations and the local floodplain management ordinance (when combined with other documentation), and to support requests for map changes. Four sections of the handbook present examples of elevation certificates, building diagrams, and photographs for structures located in AE, A, AO, and V Zones. The handbook also includes exercises to ensure local floodplain administrators can use a FIRM and can complete an elevation certificate. Overall, the workshop and handbook should give local floodplain administrators the information needed to better advise property owners regarding elevation certificates.

**Keywords:**
California, compliance, development, enforcement, floodplain management, insurance, mapping, mitigation, NFIP, substantial damage, substantial improvement

**Abstract:** This handbook provides information on a broad range of issues related to floodplain management, mapping, mitigation, and insurance. Each section of the handbook contains PowerPoint slides used by the California Department of Water Resources (DWR) to train local floodplain administrators on the NFIP. In addition to the slides, the handbook contains reprints of technical bulletins (e.g., nonresidential floodproofing) and forms (e.g., elevation certificate) issued by FEMA.

**Keywords:**
California, insurance, insurance coverage, mitigation, substantial damage, substantial improvement

**Abstract:** This handbook accompanies an advanced workshop on substantial improvement and substantial damage taught by the California Department of Water Resources (DWR) to local floodplain administrators. The handbook covers several topics: improvement costs that must be included; rehabilitations, additions, and reconstructions; acceptable methods for determining improvement costs; acceptable methods for determining market value; post disaster considerations; and Increased Cost of Compliance (ICC) coverage. DWR also provides sample affidavits for improvements and repairs, sample notices to property owners regarding substantial
improvement and substantial damage, and supplemental documents on ICC coverage in the handbook.

Keywords: California, compliance, floodplain management, strategic planning

Abstract: In February 2002, Governor Gray Davis delegated authority to the Department of Water Resources to convene a Floodplain Management Task Force (the Task Force). The Task Force focused on the intent of Assembly Bill (AB) 1147, which mandated the Task Force to examine specific issues related to state and local floodplain management and make recommendations for more effective statewide policies. The Task Force found existing programs do not adequately accomplish the goals of reducing flood losses and maximizing the benefits of floodplains. Furthermore, the Task Force identified the need for the state to comply with the NFIP. Based on its research and consideration of literature, the Task Force developed recommendations along three basic themes: better understanding of and reducing risks from reasonably foreseeable flooding; multi-objective-management (M-O-M) for floodplains; and local assistance, funding, and legislation. For example, in the theme of better understanding of and reducing risks from reasonably foreseeable flooding, the Task Force recommends local communities adopt stricter regulations than those required by the NFIP (e.g., freeboard). Another recommendation asks the state to provide additional resources to continue and expand implementation of the state’s floodplain management programs, including full support of the Community Assistance Program. The report outlines and discusses additional recommendations.

Keywords: insurance purchase decision, public policy, risk assessment, risk communication, risk perception

Abstract: This survey describes the impact that judgments and choices about low probability, high consequence events have on the policymaking process. Empirical evidence indicates that normative models of choice, such as expected utility theory, are inadequate descriptions of individual choices. The ambiguity of low probabilities also affects decisions in ways that are not normative. Further, people exhibit biases in judgments about risks and probabilities. These findings have stimulated development of new theories, such as prospect theory and generalized utility theories incorporating attributes such as regret. The authors survey many of these empirical results and explore their implications for policy. They consider the role of information, economic incentives, compensation, and regulation in inducing socially desirable effects through the reframing of outcomes. They suggest that surveys and experiments can help analysts better understand the decision process for low probability events and design more effective public policies.

Keywords: floodplain management, legal issues and litigation, legislation, North Carolina
Abstract: The NFIP has made it possible for some landowners to obtain subsidized insurance protection against flood damages. As a condition of this protection, however, the local governments in which flood-prone land is located must adopt certain restrictions on the use of land in the floodway and flood hazard areas. North Carolina’s legislative centerpiece for authorizing local floodplain regulations is the Floodway Act. This act was deficient both in terminology and in scope of coverage when examined in light of the NFIP’s requirements. To remedy these deficiencies it is recommended that the act’s coverage be broadened to include flood hazard areas beyond the floodway, to include areas of coastal flooding, and to delete the uses automatically permitted in the floodway. It is important for the state to play a major coordination and advisory role in land-use regulation for flood protection. Local governments need technical assistance in preparing and administering the necessary regulatory measures, and the state has an important role to play in coordinating local efforts with FIA and in overseeing the program. In addition, state property must meet the federal requirements in order for the state to obtain insurance or to qualify as a self-insurer. Statutory changes are suggested to meet these needs.

Keywords: coastal areas, erosion, insurance, legal issues and litigation, legislation, lending institutions, mandatory purchase, mitigation, NFIP, takings

Abstract: This article examines the background of the NFIP from its inception to 1993, reviews proposed changes to the program as a result of perceived problems with current operations, and discusses constitutional “takings” issues concerning flood insurance. After introducing the reader to the NFIP, the authors discuss proposals under consideration by Congress to change the program. For example, one of the most controversial and important proposals concerns the establishment of a program to reduce coastal erosion. Under the proposed program, FEMA would delineate 10-, 30-, and 60-year erosion setbacks along United States coastlines. In a 10-year setback zone, existing buildings would presumably be “in danger of imminent collapse,” and owners could obtain grants to cover the cost of relocation (40 percent of the building’s value) or demolition (40 percent of the building’s value). (Note: these setback requirements were not included in the National Flood Insurance Reform Act of 1994.) Finally, the article discusses the “takings” issue as it relates to the NFIP. The courts have clearly held the constitutionality of the program as witnessed, for instance, in Texas Landowners Rights Association v. Harris. In that case the court ruled, among other things, that the NFIP did not violate sovereign powers of state and local government or the principles of federalism embodied in the Tenth Amendment. A survey of additional court cases provides a broader context to the “takings” issue.

Keywords: awareness, Massachusetts, nonstructural approaches, risk perception, structural approaches

Abstract: This study examines the attitudes of citizens and government officials toward various means of reducing flood damage in Northampton, MA. The study was part of an ongoing series of investigations into flooding in the Connecticut River Basin and into economical, effective, and
environmentally sound approaches to reducing flood damages. Town residents, floodplain residents, local, state and federal officials, floodplain businesses, and local civic organization representatives were interviewed. The study compares public opinions on nonstructural and structural approaches to mitigation and finds that the former were generally supported while the latter were generally opposed, citing political infeasibility or environmental impact.

**Keywords:** methodology, mitigation, nonstructural approaches, public policy

**Abstract:** For the first 60 years of the twentieth century, U.S. policy regarding floods was aimed at flood control. In the next 20 years, policy shifted to a goal of mitigation. However, flood losses continued to rise, which prompted Congress and others to raise questions about the causes of policy failure. The answer is complicated because flood policy involves four changing issues, including the shift from federal to state and local responsibilities, the existence and form of the NFIP, the shift to nonstructural approaches for flood mitigation, and the developing programs for emergency assistance. A comprehensive assessment of research needs reveals that policy must have a view of efficient use of floodplains, not just loss reduction. The socioeconomic database is considered inadequate for many policy decisions, and the knowledge of floods is uneven, with much more known in the physical sciences than in the social sciences. Attention to interdisciplinary research involving economists, sociologists, political scientists, and geographers is needed to achieve better policymaking and flood hazard mitigation.

**Keywords:** mitigation, nonstructural approaches, structural approaches

**Abstract:** Flooding remains a major unresolved problem in the United States with losses mounting after 60 years of largely structural efforts to mitigate loss. Hence, a major two-year assessment of research needs to more effectively address flood mitigation was conducted within the context of our national shift to new federalism, the NFIP, the shift of emphasis from structural to nonstructural approaches for flood mitigation, and the evolution in national programs of emergency assistance where flooding is but one of many hazards treated. Recommendations for research centered around six general themes: (a) more attention to socioeconomic-political research; (b) a goal of efficient use of flood-prone lands, not loss reduction; (c) the importance of interdisciplinary research (70 percent of all 115 recommended tasks are multidisciplinary); (d) the need to develop comprehensive data banks and flood information centers; (e) orienting future research needs to user needs; and (f) the need for continuing re-assessment of flood research every three years.

**Keywords:** disaster planning, Midwest floods of 1993, public policy, socioeconomic impacts
Abstract: Through detailed case studies and sectoral analyses, this volume diagnoses the social and economic impacts of the Midwest floods of 1993, assessing how resource managers, flood forecasters, public institutions, the private sector, and millions of volunteers responded to it. This comprehensive evaluation of the 1993 flood examines the ways floods are forecasted and monitored, the effectiveness of existing recovery processes, and how the nation manages its floodplains. The flood offered major lessons for the public and private sectors for future flood disasters. The emphasis here is on the flood’s many impacts and the policy issues that they raise.

Keywords: hazard identification, mitigation, strategic planning

Abstract: Recent assessments of flood problems and issues are used to compile a comprehensive assessment of the research needed relevant to flooding and flood mitigation. Experienced researchers identified four new major national issues or trends: (a) a shift in responsibilities from federal to state and local entities; (b) the policy of the NFIP; (c) the shift of emphasis from structural approaches to nonstructural approaches for flood mitigation, such as floodplain management and zoning, coastal zone management, flood warning systems, evacuation and relocation, flood insurance, and land acquisition; and (d) the recognition of the developing national programs in emergency assistance. The major conclusion of the assessment is that much flood-related research must be interdisciplinary in nature. It identifies 115 high-priority research tasks in the fields of meteorology, hydrology and hydraulics, ecology, public health, economics, sociology, political science, and interdisciplinary fields. All 115 tasks met the criteria for critical research, namely, that the problem being addressed will probably be solved by further research and that the cost of the research is justified by the benefits.

Keywords: economic modeling, housing markets, Kentucky, property values, Texas

Abstract: This study reviews existing academic literature on hedonic price models of the floodplain real estate market. In addition, two hedonic price model cases were studied to answer some of the questions raised in the literature review. The case studies used price data from USACE projects in Abilene, TX, and South Frankfort, KY. Findings from the literature review and the case studies do not satisfactorily conclude that the fair market value of floodplain properties either capitalizes or does not capitalize the flood damages borne by floodplain activities. The existing studies did not seek and the case studies lacked sufficient data to detect a discount for primary flood damages. In some cases a discount for location in the floodplain does not exist. In others, a discount for floodplain location does exist, but varies because of factors such as relative location within the floodplain, flood insurance, flood history, and positive floodplain attributes. The variability of these factors across floodplain markets around the country makes the assumption that all floodplain properties are discounted for primary flood damages unreasonable. The foremost issue is including positive and negative attributes of
floodplain properties in the hedonic price model to separate the discount due to primary flood damages from the discount due to floodplain location. Identifying and measuring all these floodplain attributes presents many challenges. Future research may fail to identify all the attributes that buyers consider when purchasing a floodplain property.

Keywords: disaster planning, floodplain management, Georgia, media, risk communication  
Abstract: This presentation points out the need for communities to have a crisis communications plan to audit all vulnerabilities, establish guidelines for crisis communication coordination, state roles of key people and agencies, and precoordinate with other plans before a crisis occurs. When a crisis occurs, the document suggests that communities assess the incident, assemble a crisis team, communicate facts, and minimize rumors. It also suggests, among others, that communities should activate a crisis center, designate a lead spokesperson, develop a crisis fact sheet, contact critical players, open a media center, and establish guidelines for the news media.

Keywords: disaster planning, floodplain management, Georgia, media, risk communication  
Abstract: This presentation details the procedural guidelines to be employed whenever the Chatham County (GA) Emergency Operations Center (EOC) is activated. The goal of these guidelines is “to ensure the most rapid and comprehensive news coverage while permitting unimpeded emergency response operations.” Some of the suggested procedures include a preliminary media briefing prior to activation of the EOC; after the initial activation of the EOC, allow the media, one station or network at a time, to take file footage shots of the EOC; to make available a media office next to the press conference area in the basement; reserve parking space for media vehicles; as developing conditions permit, to conduct routine press conferences each hour according to pre-established schedules; and to accommodate specific requests for information whenever possible.

Keywords: development, Mississippi, property values  
Abstract: Based on a study of Columbus, MS, this research was designed to determine if subsidized, pre-FIRM insurance has been a cause of increases in capital investment on that community’s floodplains. The scope was limited primarily to determining the effect on new construction, on location decisions of businesses, and on land values. Analysis of flood insurance statistics, amounts of new construction, location decisions, and data on land values in Columbus revealed only insignificant evidence to substantiate the hypothesis that flood insurance has encouraged encroachment into floodplains. The results suggested that most firms did not view
the flood hazard as being as great as other types of insurable hazards. Moreover, in general, both commercial and noncommercial properties subject to flooding had shown greater increases in value than those of negligible flood hazards. The only exceptions included those with extremely high-expected flood frequencies. The effects of subsidized flood insurance on land values were relatively insignificant. Economic growth factors were primarily responsible for increases in values of land in floodplains. Lastly, the study revealed little evidence to support the hypothesis that subsidized flood insurance stimulated encroachment. Federal disaster aid appeared to provide more inducement to locate and remain on lands where flood losses were likely to be sustained.

Keywords: coastal areas, economic impacts, Mississippi, property values, urban areas

Abstract: Land-use requirements for eligibility in the early NFIP did not cause any significant decreases in total annual construction in urban coastal floodplains along the Mississippi Coast. Construction activity in A Zones continued at high levels. The relatively high cost of elevating residential structures, along with other factors unrelated to ordinances, caused some relocation of new construction to other areas of communities. The inability to construct commercial structures to comply with ordinances and maintain functional utility prevented some commercial construction. The impacts on construction employment were negligible. The value of land and existing structures increased in communities, but less so in A Zones. The county’s total construction employment and income were not affected by ordinances. In the community of Biloxi, MS, less than half of total new construction in A Zones was actually regulated due to exemptions for repairing, remodeling, and so on, not exceeding 50 percent of structure’s value. In this community, construction of regulated new structures decreased slightly, but patterns in nonresidential new structures did not confirm any decrease. Total construction in Biloxi increased since ordinances were implemented.

Keywords: disaster assistance, Louisiana, socioeconomic impacts

Abstract: The paper compares the income and approval rates of elderly single-female households and other types of households applying for disaster aid. Households from two parishes involved in the flooding in and around New Orleans, Louisiana, in May 1995 who applied for federal loans via the FEMA National Teleregistration Center were compared on demographics and outcomes. Data analysis showed that elderly single-female households were overrepresented in the population applying to FEMA; two and one-half times as likely as other elderly households or nonelderly households to have incomes of $11,000 or lower; and three times less likely than other elderly households to receive a low-interest loan. This study indicates that the current federal low-interest loan program does not adequately address the needs of poor elderly women. The author recommends special initiatives to target this population.

**Keywords:** awareness, economic impacts, insurance premiums, insurance purchase decision, risk perception

**Abstract:** The NFIP requires mandatory purchase of flood insurance for property owners who have federally backed mortgages. Krutilla (1966) noted that a compulsory national flood insurance program could greatly improve the economic efficiency of floodplain occupancy in the United States. However, in order to realize the efficiency gains suggested by Krutilla, property owners must have sufficient information about flood risk and insurance premiums to make well-informed home purchase decisions. Using survey data from Boulder, CO, this report finds significant evidence of market failure in information in the NFIP. The majority of survey respondents, all of whom live a SFHA, report they did not fully understand the degree of flood risk or the cost of insuring against this risk when negotiating the purchase of their property. Moreover, respondents overwhelming stated that when they did learn the cost of insurance, it was higher than expected. The study found that information is acquired late in the negotiating and purchase process. Insufficient information or the inability to make well-informed decisions based on available information hampers the NFIP’s capability to realize its full benefits, including improving the economic efficiency of floodplain occupancy. The report recommends that potential buyers be fully informed of the cost of flood insurance prior to negotiation, perhaps by requiring sellers to obtain an NFIP flood insurance quote as a condition of listing a property.

**Keywords:** beach nourishment, erosion

**Abstract:** This editorial discusses efforts in the United States to prevent further erosion of the country’s beaches and shorelines. It forecasts the percentage of people who will live near the shore by 2025 and hypothesizes why changes to the NFIP could be effective. It questions the validity of beach restoration projects, and discusses efforts by the federal government to shift the cost of erosion prevention programs to states and local communities.

**Keywords:** flood damage, insurance industry, United Kingdom

**Abstract:** The report addresses the present status of flood insurance-related professions in the United Kingdom and assesses the capabilities and limitations of the flood insurance industry as part of a comprehensive response to flood disasters. Included among insurance-related professionals are insurers, reinsurers, brokers, loss adjusters, loss assessors, insurance analysts, risk assessors, contractors, building regulators, mortgage lenders, and banks. The ability and willingness of insurers in the United Kingdom to carry financial responsibility for flood costs is being reduced by the increasing amount of floodprone assets, the increasing competitiveness of the industry, the decreasing commercial viability of general insurance, and tighter financial
regulation. The report reveals that the relationship between flood insurance and floodplain development is complex. However, this complexity, in as much as it contributes to partnerships between the parties involved, may be the solution to problems in the flood insurance industry. The report recommends identifying the link between responsibility and liability, and the way in which it can be managed effectively. Without action, the report states that the viability of the flood insurance industry in the United Kingdom will continue to decline in the face of mounting costs and deteriorating industry structure and infrastructure.

**Keywords:**
community associations, insurance premiums

**Abstract:** The Community Associations Institute (CAI) represents the nation’s 205,000 condominium associations, cooperatives, and homeowner associations. In the opinion of the CAI, FEMA’s residential condominium/association building policy (RCBAP) contains a coinsurance requirement that places an undue penalty on community associations and has skewed data for rate determinations. CAI further suggests that FEMA should eliminate the coinsurance requirement, as the NFIP does not require coinsurance for any other type of building. Eliminating the requirement will allow for affordable premiums by way of lower coverage limits. In turn, more associations would carry flood insurance allowing for a broader premium base to help FEMA absorb large shock losses and help minimize adverse selection. CAI also takes issue with FEMA’s policy deductibles (limited to $1,000 and $5,000), and suggested that FEMA allow for higher deductibles so that associations can afford to carry flood insurance. Increased coverage will reduce the risk of loss due to the perils of flood, heavy rains, or other water sources. Attendant to higher deductibles should be dramatic reductions in rates. Since the majority of flood claims occur in the first dollar layers of coverage, self-insuring associations (those that choose high deductibles) will be rewarded with significantly reduced premiums.

**Keywords:**
domestic violence, health effects, North Dakota, socioeconomic impacts

**Abstract:** Community professionals observed an increase in domestic violence during the aftermath of the 1997 Grand Forks flood. In the past, research has documented emotional symptoms that result from natural disasters, and separate studies have observed domestic violence to result from these same emotional symptoms. No research was found, however, specifically on the effects of natural disasters on domestic violence. The current study tested the effects of a model of variables on domestic violence, including flood impact, the emotional symptoms, as well as other intervening variables that might act as a buffer against the effects of flood impact. Results of this cross-sectional survey of 140 adults in Grand Forks, ND, indicate that domestic violence was significantly greater among respondents after the flood. Flood impact led to increased levels of anxiety, depression, and hostility. Whether these emotional symptoms subsequently led to increased domestic violence depended on the level of social support, the age
of the respondent, and whether he/she had a history of domestic violence before the flood. Those with lower social support, the elderly, and those with a prior history of violence were most affected. The results have implications for work with the elderly, with domestic violence treatment and prevention programs, and with communities affected by floods.

Keywords: NFIP
Abstract: This report addresses the capability of flood insurance and wetlands restoration to reduce negative effects of flooding, in light of what it views as numerous problems with the NFIP. First, it notes that by design, the NFIP is not actuarially sound because it subsidizes premiums to increase program enrollment. Second, recent efforts to decrease premium subsidies have lead some policyholders to stop renewing their policies. FEMA recently estimated that 27 percent of property owners who reside in the floodplain hold flood insurance policies. The problem of repetitive-loss properties has also damaged the viability of the NFIP. In Minnesota, for example, 46 properties have made 137 loss claims totaling over $1.6 million. Because of inaccurate or outdated maps, FEMA lacks a means of estimating NFIP participation rates because it does not know the total number of structures in floodplains. Without accurate maps, the NFIP cannot set premiums – subsidized or not – that correspond to risk. Map modernization efforts are underway, but the completion of new maps will take years. The author further notes that local authorities have been reluctant to enforce zoning and building regulations in compliance with NFIP minimum standards. The report adds that there are few incentives to pay for insurance in light of the multiple layers of assistance available to property owners. In all, the author praises the steps taken to improve the program but sees a number of persistent problems.

Keywords: dams, flood control, North Dakota
Abstract: The article explores the concept that man-made floodplain management solutions might be exacerbating flood losses by highlighting a proposed dam on the Maple River in North Dakota. Proponents of the dam argue that it will prevent flooding in downstream communities frequently subject to flood disasters. Opponents of the dam argue that it will divert watercourse and flood productive farmland and disturb Indian cultural sites. Also, the dam could contaminate the local water supply, an aquifer that supplies water for the residents and the Archer Daniels Midland oilseed processing plant, a large local employer. Without a clean water supply, the processing plant will leave, decimating the local economy. The effects of the proposed dam are unknown and some speculate that drainage tiling by farmers will negate the potential beneficial effects of the dam.

Clinton, William J. (1995). Message to the Congress transmitting the report on floodplain management. Weekly Compilation of Presidential Documents, 31(10), 372-7. Keywords:
floodplain management, Mississippi River

Abstract: This message focuses on the proposal to reform floodplain policy for the Mississippi River in the wake of the damage caused by massive floods in 1993. It discusses the impact of the flood on agricultural and urban property owners, the construction of mainstream levees, and the conversion of wetlands to agriculture. The message concludes that the conversion of floodplain and wetlands to agriculture throughout the Mississippi River Basin has been extensive. Eighty percent of the floodplain wetlands of the Lower Mississippi River have been cleared and converted to cropland. Clearing rates in much of the Upper Basin and the Missouri River system have been comparable. The message also suggests that the Mississippi River’s system of dams, levees, and river training works is tremendous but not sustainable over the long term: “People have gone too far in severing the river and its tributaries from their floodplains. The message from the floods is that the Mississippi wants to recapture the floodplains that historically were part of the river. It lies in wait for major flood events to do this.” The message concludes by noting that: “A program of floodplain restoration would go a long way towards creating a much more sustainable, low-cost flood management system in the Mississippi River Basin than exists today.” Finally, the President suggests that the Corps of Engineers must reform how it spends federal dollars on flood control works in the basin, while the federal government expands the Wetland Reserve Program created by the 1990 Farm Act in the Mississippi Basin.

Colegio de Ingenieros y Agrimensores de Puerto Rico, Agencia Estatal para el Manejo de Emergencias y Desastres, y FEMA. (2002). Inundaciones y Derrumbes en Puerto Rico: Guía de Mitigación de Daños. San Juan, PR: Agencia Estatal para el Manejo de Emergencias.

Keywords: disaster planning, flood causes, mitigation, NFIP, Puerto Rico

Abstract: This guide provides information to residents on serious problems that continually affect Puerto Rico: floods and landslides. The first and second sections of the guide discuss in detail the phenomena of floods and landslides including their histories in and consequences to the island. The third section focuses on the regulations that apply to construction in areas prone to flooding. Emphasis is given to the interpretation of FIRMs and Puerto Rico’s participation in the NFIP. The fourth section provides information on how to prepare for, confront, and cope with flooding. The fifth section focuses on alternatives and solutions to mitigate the effects of floods and landslides on residential construction. Finally, an appendix lists contact information for organizations and agencies involved with disaster planning and assistance.

Keywords: California, Florida, Hawaii, Hurricane Andrew, Illinois, insurance, mitigation, Oklahoma, Wisconsin

Abstract: The author states that private insurance companies were shocked by losses from natural disasters such as Hurricane Andrew. Consequently, most companies no longer offer disaster insurance along with a traditional homeowner policy in California, Florida, and Hawaii. Coverage is available only through state-managed disaster insurance pools with high premiums, high deductibles, and limited coverage. The author points out that until 1996, disaster
appropriations were designated as emergency funds and were therefore exempt from budget limitations. The 104th Congress changed that rule, and now supplemental disaster appropriations require compensating cuts from other domestic programs. Thus, the author argues, although the public believes that insurance is unnecessary because FEMA will be there to pick up the pieces, the reality is that federal disaster recovery programs will be subject to political whims and partisan deals. To bolster disaster recovery, new policies that promote shared risk and responsibility are urgently needed. The author explains that, because of the limited availability of insurance and caps on federal spending, FEMA has advocated establishing “disaster resistant communities.” Under this strategy, seed funds would be provided to cities to promote mitigation of hurricane hazards by building owners before disaster strikes in order to limit federal and personal recovery costs. This program has enjoyed some success. However, the success of individual projects does not necessarily translate into regional or national programs. One of the limitations of this program is that, despite the fact that mitigation can reduce losses the real estate market does not reward a building owner for such expenditures in higher rents or higher property values. Similarly, FEMA has a program to buyout homes and property in flood-prone communities are purchased and converted to parks or wetlands. Although this program has been a success in a few small towns in Illinois, Wisconsin, and Oklahoma, most owners simply refuse to move or even elevate their homes. The author argues that the promotion of predisaster mitigation by the government will need a combination of regulation and incentives. Tax credits are an obvious incentive, she notes, but she also complains that they tend to go to those who would do the mitigation anyway. To reach a large number of homeowners and some apartment owners, it is important to devise a policy that taps into the real estate marketplace. The author concludes that, since FEMA wants to promote mitigation to reduce costs, the agency should promote policies to help insurance companies return to the market and promote programs that incorporate safety assessments into real estate transactions.

**Keywords:**
insurance industry, legislation

**Abstract:** The bill authorizes a national program under which flood insurance is made available to residents of flood-prone areas. The provision of flood insurance supplements infrastructure investment in structural mitigation and relief measures following flood disasters, neither of which has proven to be a permanent solution to the costs of flood disasters. The bill stipulates that flood insurance policies outstanding shall not exceed $2.5 billion initially. Discussion of the bill includes a demonstration of the performance of the flood insurance program in illustrative examples of minor and major floods.

**Keywords:**
insurance industry, legislation

**Abstract:** Title XII of the act establishes a flood insurance program under the direction of the Department of Housing and Urban Development (HUD). The act seeks to maximize the involvement of the private insurance industry and perceives a completely federal program as the least desirable form for a national flood insurance program. The objectives of the land-use
criteria for protected land are to restrict development in flood hazard areas, reduce damage caused by floods, and improve long-term land management and use of flood-prone areas. Residents who pay premium rates below actuarial cost will be limited in the amount of liability in their insurance: to $15,000 per dwelling unit and $30,000 for any single structure. The act prescribes that rate studies be carried out by the Army Corps of Engineers, the U.S. Geological Survey, the Soil Conservation Service, and the Tennessee Valley Authority. Federal subsidies are justified as a temporary solution to the long-range readjustment of land-use patterns. The act also authorizes HUD to borrow money from the Department of the Treasury to cover program costs.

Keywords: building codes, coastal areas, hurricanes, property values

Abstract: This book examines problems raised by destructive hurricanes with respect to the growing concentrations of people and property in high-risk coastal areas. It also discusses the urgent need to provide better protection for people, buildings, and communities through more rigorous construction standards and better enforcement of building codes, flood insurance requirements, and land-use regulation in areas subject to hurricanes. It includes an appendix showing the value of insured coastal property exposures by state for counties bordering the Atlantic Ocean and the Gulf of Mexico.

Keywords: buyouts, floodplain management, nonstructural approaches, mitigation, Project Impact, relocation, repetitive losses, substantial damage

Abstract: This report reviews the status of voluntary property buyouts and relocations as a strategy for floodplain management. In addition, the report analyzes the 18-year history of repetitive flood losses to identify communities that may have significant potential to utilize new nonstructural approaches to reduce flood hazards. The report provides recommendations for program and policy changes to improve floodplain management and to increase the utilization of nonstructural approaches to reduce flood damages. Some of the offered recommendations include: the need for federal, state, and local governments to coordinate and develop predisaster hazard-mitigation plans to facilitate timely, coordinated hazard-mitigation efforts before and after floods occur; the need for Congress and the Executive Branch to provide support for programs such as FEMA’s Project Impact and to develop a flexible, consolidated, and streamlined voluntary buyout and relocation assistance program; the need for FEMA and Congress to revise flood insurance rate schedules and community participation standards for the NFIP to provide increased incentives to reduce flood risks; the need for FEMA to enforce the NFIP’s substantial damage requirement for elevation or removal of substantially damaged buildings after floods; the need for Congress and the Executive Branch to eliminate the current bias in federal water resource project planning and evaluation procedures that favor structural
approaches for flood damage prevention and mitigation over nonstructural approaches; the need for Congress to reduce the basic cost-share for federally supported flood control projects to 50 percent, with incremental cost-share incentives to promote flood hazard mitigation ranging to a maximum 65 percent federal cost-share; and the need for Congress and the Executive Branch to increase levels of funding and support for programs that provide technical assistance to states and communities for improving floodplain management and flood loss reductions activities.

**Keywords:** coastal areas, development, economic modeling, insurance premiums, subsidies

**Abstract:** Residential development on beaches grew faster in the past 32 years than residential development generally. In the 42 beachfront communities examined for this paper, the average annual rate of growth in housing units (3-9 percent) was well above the nation generally (2.4 percent) between 1960 and 1992. The authors offer an econometric model to measure the extent to which this growth can be attributed to (a) demand for recreational property; (b) public investments in shore protection (such as USACE projects) and (c) the NFIP. They conclude that, on balance, “the growth in beach front communities has been prompted mainly by increased demand for recreation caused by rising income and employment in inland areas. Federal flood insurance also appears to have encouraged additional shoreline development. But public investments in shore protection seem to have had little or no effect.” The authors go on to say the NFIP’s effect depends on whether the insurance premium is subsidized. During the emergency phase of the program, before flood insurance rate maps are available, the authors’ model suggests that the NFIP had a significant positive effect on residential development, resulting in an increase of building permits of about 50 percent over what they otherwise would have been. This finding is in direct contrast to the conclusion of the General Accounting Office (1982) that said the program had only marginal effect on development. It supports the findings of Shilling, Sirmans, and Benjamin (1989) that during the NFIP’s emergency phase, the program created an incentive to develop as much land as possible before a FIRM was finished. Developers recognized that property built after the map was in place would not qualify for subsidized insurance rates. This is carried forward in the authors’ further finding that once a community moved into the regular (post-FIRM) phase of the program when insurance would be available only at actuarial rates, the program did not precipitate growth or development.

**Keywords:** coastal areas, Coastal Barrier Resources Act, development, erosion

**Abstract:** The report uses the survey of structures from FEMA’s Erosion Hazards Study to examine whether federal flood insurance encourages economic development along coastal shorelines. The report used the development histories for seven sites in North Carolina, Georgia, Florida, South Carolina, Texas, and California to construct measures of development density. The study found that development density has increased over time, coinciding with a rising
demand for beachfront recreation. In the absence of flood insurance, development density is roughly 20 to 30 percent less in areas that are prone to flood risk than in areas that are not prone to flood risk. The study found that federal flood insurance has had the effect of increasing development density in areas prone to flood risk between 11 and 18 percent. Areas designated as CBRA areas, where a variety of federal funding sources, including flood insurance, are unavailable, exhibited between 40 and 60 percent less development density. CBRA areas are typically less developable than other coastal areas. With respect to flood insurance, one might expect that better information about flood risk provided by flood maps might reduce development density. However, it is possible that the cost of higher building codes required by the NFIP might be exceeded by damages avoided, actually encouraging development. Also, subsidized flood insurance rates could allow property owners to underestimate flood risk, and encourage denser development.

**Keywords:** development, floodplain management, geographic information systems, Portugal, urban areas

**Abstract:** Some of the most critical flood problems occur in urban areas where values at risk are higher and damages tend to be larger than in nonurban areas. Fast developing urban regions raise problems because of the unsteady situation of these regions in terms of catchment land-use and urban encroachment. A realistic approach to flood management in these situations requires the consideration of urban growth scenarios and the simulation of the corresponding flood conditions. Coastal towns are frequently located in floodplains and are subject to flood hazard. This is the case for many coastal areas in Southern Europe that are still developing fast due to immigration. In such cases, flood management cannot be disassociated from land-use management, and non-structural measures for flood control can play a crucial role. It is important to make an ex-post evaluation of these measures in areas where they have been adopted. These issues are addressed in two Portuguese catchments, representative of urban growth and related to flood problems in Portugal and other Southern European regions. The Laje catchment is used for the ex-post evaluation of nonstructural measures, and the Livramento catchment is used for the modeling of urban growth scenarios. Quantitative results and policy recommendations are presented based on these two case studies. Floodplain management is better done with Geographic Information Systems (GIS), especially if it is linked to hydrologic and hydraulic modeling capabilities. The use of GIS for conducting these studies is presented in Part II of the article.

**Keywords:** development, floodplain management, geographic information systems, urban areas

**Abstract:** In Part I of this article the very dynamic nature of floodplain management was discussed and the need for modeling the urban growth processes and formulating scenarios of urban development was emphasized. In this second part, the use of Geographic Information Systems (GIS) for addressing those problems is presented. GIS has been recognized as a
powerful means to integrate and analyze data from various sources in the context of comprehensive floodplain management. Adequate information and prediction capability is vital to evaluate alternative scenarios for flood mitigation policies and to improve decision-making processes associated with floodplain management. A framework for the comprehensive evaluation of flood hazard management policies is also addressed in this article. This comprehensive approach to flood problems is more than an attitude or a philosophical starting point. It makes use of specific technological tools conceived to be used by different actors, some of them being non-experts in flood analysis. These tools, based on GIS, are appropriate for a participatory approach to the formulation of strategies for floodplain management because they help communicate with the public in a scientifically correct and yet rather simple manner.

Keywords: federal programs, flood damage, Hurricane Floyd,

Abstract: Hurricane Floyd did more than destroy real estate. By the time the cleanup and rebuilding are complete, U.S. taxpayers will have paid for Floyd through subsidized flood insurance as well as grants and low-cost loans to people living in federally designated disaster areas. The author believes that government policies thwart sensible behavior. They make it too easy for people to live in beautiful but disaster-prone places such as barrier beaches, floodplains, cliff sides, tinder-dry canyons, and seismic fault zones. That is one reason why financial losses from natural disasters are growing at a rate faster than the economy itself is expanding. The solution is not an elaborate new government disaster-relief program. In most cases, the best thing the government can do is to get out of the way and let the free market do its work. James Lee Witt, Director of FEMA, advocates denying subsidized flood insurance to people who make repeated claims and refuse to take preventive measures, ranging from sealing their basements to raising their houses on stilts. A version of the proposal was introduced in the House of Representatives this summer as the “Two Floods and You Are Out of the Taxpayer’s Pocket Act.” Meanwhile, the Coastal Barrier Resources Act is up for reauthorization. A revamped disaster-insurance program would not only save money, it would save lives. With the proper incentives, people will choose to live in safe homes on safe ground and everyone will benefit.

Keywords: England, flood disaster planning, floodplain management, insurance, legislation, mitigation, nonstructural approaches, public policy, risk management, Scotland, Wales

Abstract: Since 1995, the author has been concentrating on nonstructural measures, such as planning controls and sustainable drainage. Through this report, he hopes to show that nonstructural approaches have been particularly successful in Scotland. Many experts around the world now see nonstructural measures as being a more sustainable, efficient way to tackle flood-related problems. For example, years of meetings at the local level have given the author an
opportunity to influence planning strategies for communities throughout Scotland. Current planning strategies for most of these communities now prohibit any new housing development where the flood risk exceeds the 200-year event. In addition, differences in legislation in Scotland have resulted in preparations being made for a test case for insurers to recover up to £70M in claims payments from a local authority in Scotland. If successful, it could have important implications for the flood risk and insurance in England and Wales. The author’s discussions with senior underwriters of many of the leading British insurance companies have indicated that they have little awareness of what Scotland has achieved. He hopes that this report will help to remedy that situation. While the solutions are working well in Scotland, it may already be too late for southeastern England, where some radical measure may be required in the future. The future outlook section at the end of this report lists some of these measures.

Available at: http://www.benfieldhrc.org/SiteRoot/activities/misc_papers/Temporary_local_flood_protection.pdf

Keywords: insurance, NFIP, structural approaches, United Kingdom

Abstract: Traditionally there have been two types of temporary flood protection, sandbags and flood boards. In recent years, numerous systems have been invented to improve on these methods and there are currently roughly 150 temporary flood protection products in the United Kingdom alone. Flood insurance in the United Kingdom is becoming more expensive and less available, primarily because of the cancellation of the insurance industry guarantee of universal cheap flood insurance in 2002. As a result, demand for temporary protection is growing rapidly. Temporary flood protections are not inexpensive, however. Consumers are increasingly looking to the insurance industry to provide discounts from their flood premium if temporary flood protection devices are used. While the paper is directed at insurers, it may also be beneficial to local authorities and property owners who are considering purchasing such products. It outlines and compares different types of systems according to performance characteristics, such as ease of deployment and effectiveness. It also describes the British Standards Institute tests introduced in 2003.

Keywords: Florida, insurance purchase decision, risk communication, risk perception

Abstract: This study examines the effectiveness of realtors and mortgage bankers in communicating risk associated with flood zones to prospective homebuyers within the Lower Florida Keys. Different states have different laws regarding realtor obligations to inform homebuyers of natural hazard risk. However, courts may hold real estate agents and brokers liable for failure to disclose hazards even when the law does not explicitly require them to do so. The study found that only 52 percent of prospective homeowners reported being advised about the threat of hurricane flooding by realtors. Survey responses from realtors contradicted this figure. Nevertheless, the proportion of homebuyers who reported that they were informed of the
threat of hurricane flooding has risen over the past few years. Methods of hazard disclosure were highly variable among real estate professionals, and only 27 percent reported having a personal or office policy concerning hazard disclosure. Conversely, realtors reported that few homebuyers asked about hurricane safety. The impact of realtors is limited for purchasers of mobile home residences, nearly half of who purchased their homes directly from a previous owner. Over one third of residences in the area studied are mobile homes.

Keywords: coastal areas, development, Florida, insurance
Abstract: Based on a survey of realtors in the lower Florida Keys, the author concludes that the availability of flood insurance might have contributed to an increased occupation of coastal flood zones.

Available for purchase at: http://www.usc.edu/schools/sppd/ijmed/purchase.html
Keywords: Florida, hurricanes, risk perception,
Abstract: Data on perceptions of the hazards associated with hurricanes, periodically collected over a 12-year period from the same sample of Lower Florida Keys residents, were analyzed to determine what changes in hazard perception and mitigation behavior had occurred. Contrary to hypotheses that concerns about hazards decline with length of residence in hazard zones, overall perceptions that both hurricane winds and flooding are problems facing local residents have increased. Awareness of the hurricane threat remains high, with two-thirds of the residents stating that it is likely that the area will experience a damaging hurricane within the next 10 years, even though a major hurricane has not occurred within the area for nearly three decades.

Keywords: coastal areas, erosion, insurance premiums, mapping
Abstract: The National Flood Insurance Reform Act (NFIRA) was enacted into law on September 23, 1994. Section 577 of the Act requires that FEMA to submit a report to Congress that evaluates the economic impact of erosion and erosion mapping on coastal communities and on the NFIP. Section 577 follows many years of debate concerning whether the effects of erosion should be considered in mapping flood risk zones and setting rates for flood insurance.

Available at: http://www.cerf-jcr.org/Historical_Shoreline_Change.pdf
Keywords: coastal areas, erosion, mapping, Upton-Jones Amendment
Abstract: FEMA is assessing technical methodologies and procedures for the collection, analysis, and computation of coastal erosion rates. This assessment is being performed to
determine the feasibility of generating such data for use as a basis for administering Section 544 of the Housing and Community Development Act of 1987 (commonly known as the Upton-Jones amendment to the NFIP). It is likely that the methodology selected will involve the use of historical data compared with current shoreline information. Several states use this fundamental approach to predict shoreline location based on extrapolation of past changes in developing data to support setback programs. Requirements contemplated for data development include: (a) standardization of a methodology for developing data on erosion rates; (b) consistency in application; (c) capability of being applied in a timely manner; and (d) accuracy commensurate with program needs. This paper addresses the last issue by examining sources of errors inherent in the raw data. Source data include historical and recent National Ocean Service (NOS) T-sheets (produced ca. 1840s to present) and air photos (taken ca. late 1930s to present) as well as any other types of accurate map and photographic data. A study of this nature requires extensive preparation of the required source material prior to digitization. For example, the high water line or bluff line must be identified and annotated on the air photos and maps. Furthermore, the source material must undergo extensive pre-digitization and post-data compilation accuracy checks and reliability assessments necessary to screen inaccurate maps and air photos. For example, older historical maps with obsolete coordinates must be updated to current standards and analyzed to insure that distortion has not rendered the map inaccurate and unusable. In addition, computerized techniques (e.g., metric mapping and analytical stereoplotter) or manual techniques (e.g., Zoom Transfer Scope) must be used to correct for distortion inherent in aerial photography.

Keywords: coastal areas, cost-benefit analysis, economic impacts, erosion, hazard identification, legislation, mapping, Upton-Jones Amendment

Abstract: This article reports on the background and details of a study to evaluate the impact of erosion and mapping of erosion on coastal communities and on the NFIP. The study known as the “Evaluation of Erosion Hazards” and required by the National Flood Insurance Reform Act of 1994 is being conducted in two phases. During Phase I, FEMA mapped 60-year erosion hazard areas in 27 counties distributed among 18 coastal and Great Lakes states. During Phase II, FEMA will conduct an inventory of structures that are located within the 60-year erosion hazard areas and current projected flood zones, analyze the economic impacts of erosion and erosion mapping and their impacts on the NFIP, and determine whether it is cost-beneficial for FEMA to map erosion hazard areas. The final report will be submitted to Congress in January 2000. Conclusions of the report will help provide closure to a long-standing debate and congressional concern as to whether FEMA should map coastal areas with erosion hazards and use these data in determining insurance premiums and land-use provisions through the NFIP.

Keywords: Community Rating System, strategic planning
Abstract: The Community Rating Task Force (C RTF) formed an Evaluation Committee in January 1994 to evaluate whether the CRS was on track with original expectations and to meet long-term goals. Members of the committee developed materials and reviewed preliminary analyses in order to prepare this planning report. Furthermore, the evaluation committee concentrated on laying the groundwork necessary to evaluate and answer critical questions about the CRS. This work entailed the development of components that provide the framework of a complete description of the CRS strategy, objectives, evaluation criteria, and plans for data collection. In addition to addressing the concerns of the CRTF and FEMA, the committee attempted to include concerns of other NFIP/CRS constituencies in developing evaluation plans.

Abstract: The purpose of this update to the CRS Evaluation Planning Report is to provide the latest schedule for carrying out the evaluation efforts, supply revisions and refinements to two major items discussed in the original document, and elaborate on some of the background of CRS and the reasoning that went into the evaluation plan.

Keywords: agency operations and management, disaster planning, federal programs, history, legislation, NFIP, public policy

Abstract: The article addresses the roots of FEMA’s recent move to the Department of Homeland Security. The move was influenced by new legislation and executive influence, by the outcomes of the agency’s bureaucratic “turf wars” with other federal departments or agencies, by internal staffing decisions that relied on generalist managers more than technical managers, and by experience with human-caused disasters ranging from terror bombings to radiological and hazardous materials incidents. Also, the move to an all-hazards emergency management strategy made the incorporation of FEMA into the Department of Homeland Security logical.

Keywords: developing nations, mitigation, riverine areas, socioeconomic impacts, structural approaches

Abstract: Most efforts designed to reduce the effects of floods have focused on such structural measures as the construction of dams and embankments (polders, levees, and the like). Many of these large-scale, capital-intensive projects had been questioned on both technical and environmental grounds. Development experts question whether large-scale flood control projects are economically suitable for the least-developed countries since they increase the country’s debt significantly for little economic return. Some flood control projects may be counterproductive. Embankments may foster unrealistic expectations that all flooding can be prevented and stimulate movement onto floodplains, thereby increasing total risk. In recent years, there has
been increased interest in alternative strategies for protecting the floodplains, especially in rural areas. A key strategy has been to encourage people living in rural areas and in some small communities to adapt to floods and to capture their benefits for economic development. Traditional rural societies have developed many ways to adapt to floods and their consequences. These strategies can often be adopted or modified into a “living with floods” strategy. Where this strategy has been applied, it has been cost-effective, easy to implement, and compatible with the environment. These measures can be applied before and after floods. More important, they can be incorporated in long-term development programs at little cost

**Keywords:** federal programs, insurance

**Abstract:** This book formulates a clear-cut case for developing a comprehensive system of disaster insurance as an alternative to what the authors consider to be a paternalistic federal policy. To do so, the authors searched the literature relevant to insurance for disasters. These studies and reports were primarily concerned with organizational problems during the emergency postdisaster period and only occasionally referred to economic phenomena. The authors’ treatment of the economics of disaster can be conveniently divided into three parts: (a) the framework for analysis; (b) empirical evidence on short-term recuperation behavior; and (c) the capital and labor needs facing disaster areas. The authors also critically examine the federal government’s role in providing disaster relief to the private sector. The Small Business Administration (SBA) was the principal agency offering low-interest loans for replacing or repairing damaged homes and businesses. The authors explore the inequities of the SBA program and suggest alternative policies for eliminating these effects. They conclude that comprehensive disaster protection under the alternative system should lead not only to a more efficient and equitable recovery but would also curtail the growth of hazard-prone areas that resulted from the existing relief program.

**Keywords:** coastal areas, environmental protection, erosion, legislation, public policy, subsidies, takings

**Abstract:** This article discusses proposals by Congress to strengthen the NFIP through restrictions on coastal construction and limitations on the federal government’s exposure to insurance claims. However, some critics of the NFIP would like to see the program abolished altogether. Many of these critics represent environmental concerns and believe the NFIP and other federal programs essentially subsidize beachfront housing for the affluent. Furthermore, they state that the National Flood Insurance Fund lacks the money to cover several serious storms in a short period of time. Recent debate centers on a bill that would increase pressure on banks to make certain property owners in flood-prone areas carry flood insurance. The bill would also use penalties and incentives to direct communities to create maps showing the projected effects of erosion over 10-, 30-, and 60-year periods. The maps would mark setback zones and flood insurance would not be available within the 10-year setback. This provision most alarms representatives of the real estate industry, who argue that setback zones are tantamount to the taking of private property. Supporters of the bill say it would not stop building on the beachfront
but would stop the public subsidy for such building. (Note: these setback requirements were not included in the National Flood Insurance Reform Act of 1994.)

Keywords:
Coastal Barrier Resources Act, coastal barriers, Delaware, development, economic modeling, housing markets, insurance coverage

Abstract: This thesis examines the effect of the Coastal Barrier Resources Act (CBRA) on development in coastal Delaware. Passed in 1982, CBRA was designed to minimize loss of human life by discouraging development in high-risk areas, reduce wasteful expenditures of federal resources, and protect natural resources associated with coastal barriers. Using data from an original survey and tax data from Sussex County, the thesis explores whether CBRA has affected development (i.e., the housing market) in terms of five variables. The variables include density of development, pace of development, value of housing, information on flood insurance, and protective measures taken against storms. From this study, CBRA appears to have no negative effect on the density or pace of development or on the value of housing. The amount of insurance coverage is similar in both the CBRA and non-CBRA areas examined. However, property owners in the CBRA area pay substantially higher insurance premiums. With regards to protective measures taken against storms, property owners in the CBRA area utilized more of them, but it is unknown whether CBRA influenced these decisions. Overall, the study finds that CBRA has had minimal effect on the housing market in coastal Delaware as measured by five explanatory variables.

Keywords:
agency operations and management, disaster assistance, federal programs, public policy, strategic planning

Abstract: In this study, the researchers investigated the evolution of the disaster assistance programs of FEMA from the Bush Administration to the Clinton Administration. The federal response to Hurricane Hugo, the Loma Prieta earthquake, and Hurricane Andrew revealed serious flaws in FEMA’s structure and procedures. Extraordinary tensions existed between the secretive National Preparedness Directorate and the more public State and Local Programs and Support Directorate. The Bush Administration frequently bypassed FEMA and centralized response in the White House. The administration’s response to catastrophic disasters was largely reactive. Little of the funding went toward mitigation of future disasters. The media, Congress, and several evaluative organizations including the General Accounting Office, the National Academy of Public Administration, and FEMA’s OIG all underscored the shortcomings of FEMA’s structure and operations. Learning from the Bush experience, the Clinton Administration moved quickly to recast federal disaster response. President Clinton appointed James Lee Witt, Arkansas’s emergency services director as director of FEMA and elevated the FEMA’s director to cabinet-level status. Director Witt moved to redefine FEMA’s mission, reorganize the agency around basic emergency management functions, make FEMA more
consumer oriented, rebuild the staff’s commitment to FEMA’s mission, and redirect the focus of
disaster assistance toward mitigation. Consequently, media and political criticism has
diminished. However, FEMA is not free from problems. The agency still needs to address issues
regarding financial management and decision criteria.

Daun, Margaret and David Clark. (2000). *Flood Risk and Contingent Valuation Willingness
Urban Environmental Risk Management.
Available at: [http://www.marquette.edu/environment/TR6.pdf](http://www.marquette.edu/environment/TR6.pdf)

**Keywords:** attitudes, economic modeling, methodology, risk perception

**Abstract:** The study estimates the benefits of maintaining the current level of flood risk using
the Contingent Valuation (CV) method, and specifically, Willingness to Pay (WTP) surveys. CV
is a survey-based approach to valuing nonmarket goods that relies on questionnaires and is
contingent on the characteristics of the scenario presented – in terms of spatial scope as well as
frequency – and the effect of improvement in overall stream quality that reduce ecological risks.
The survey takes into consideration private, public, direct, and indirect benefits of reducing flood
risk: many environmental resources potentially affected by flooding are purely public goods, in
that they are nonrivalrous and nonexcludable. The study found that a household’s willingness to
pay for the maintenance of current levels of flood risk is positive relative to flood risk. In other
words, those in greater danger of flooding are more willing to pay for their current level of flood
protection. However, the survey also found that homeowners have considerable difficulty
valuing more than one nonmarket good, in this case a combination of policy options for reducing
flood risk. The report offers further recommendations for flood policy and survey methods.

David, Sheila, Sarah Baish, and Betty Hearn Morrow. (1999). *Uncovering the Hidden Costs
Available for purchase at: [static.highbeam.com/e/environment/october011999/uncoveringthehiddencostsofcoastalhazardshurricanes](static.highbeam.com/e/environment/october011999/uncoveringthehiddencostsofcoastalhazardshurricanes)

**Keywords:** coastal areas, disaster resistant communities, economic impacts, flood disaster planning,
Hurricane Hugo, North Carolina, Project Impact, socioeconomic impacts, South Carolina

**Abstract:** The article contends that current loss estimation from hurricanes neglects indirect and
secondary costs – both quantifiable and non-quantifiable – including social impacts and natural
resources costs, and thus do not reflect the true costs of the disaster. Among the “hidden” costs
are business interruptions and failures, social problems such as family trauma, disruption of
governmental and private social services, and damage to natural resources and ecosystems. There
is often no mechanism for systematically identifying, evaluating, or reporting these costs. The
authors use Hurricane Hugo, which battered the Carolinas in 1989 with losses estimated at $7
billion, as an example of unmeasured costs. One unquantified social cost of the storm is
homelessness, which prior to Hurricane Hugo was not a significant problem in the area.
Vulnerability to a natural disaster is not equally distributed across socioeconomic categories. The
authors note that all but two of Charleston County’s 275 public housing units were damaged,
affecting 1,300 families. Households with the least ability to supplement federal and outside aid,
and the least access to networks for support, were hardest hit. Damage to the natural environment
resulted in the extinction of several species that were previously threatened or endangered and serious beach and dune erosion. Industries that rely on natural resources, such as timber, commercial fishing, and beach recreation were disrupted and damaged. The report recommends the development of accurate community vulnerability studies, estimates of benefits from mitigation measures that account for beneficial indirect and secondary effects, and the planning and siting of development and infrastructure in line with disaster scenarios. The authors describe disaster-resistant communities, or those containing provisions to reduce losses to humans, the environment, and property, as the best means of identifying, measuring, and mitigating the full costs of natural hazards.

**Keywords:** compliance, mitigation, pre-FIRM structures, substantial damage, substantial improvement,

**Abstract:** The Program Policy and Compliance Division of the Office of Loss Reduction prepared this internal report at the request of the Federal Insurance Administrator. The report summarizes data from the NFIP claims file on insured structures substantially damaged by floods between 1978 and 1988. For each substantially damaged structure, the claims file provided the owner’s name, address, dollar amount of damage, loss date, structure value, damage as a percent of structure value, dollar amount of claim paid, and flood zone designation. Analysis of these data reveals that 18,558 insured structures have been substantially damaged for a total loss of $438,730,198. Of this, the NFIP paid $332,305,065 in claims. Further, the average substantially damaged structure incurred damages equal to 72.5 percent of its value. Several other trends emerge from the analysis. For example, 67 communities experienced 50 or more substantial damages during the period from 1978 to 1988, accounting for over one-half of all substantial damages in the nation. According to the report, FEMA and the states should concentrate technical assistance in these communities with high numbers of substantial damages. In addition, data on substantial damage could serve as an effective tool for post-flood damage assessments and various hazard mitigation programs.

**Keywords:** compliance, enforcement, substantial damage, substantial improvement

**Abstract:** As part of a joint effort to evaluate the NFIP’s definition of substantial improvement and its enforcement at the local level, ASFPM and FIA distributed a questionnaire requesting comments on various issues related to substantial improvement. Seventy-three questionnaires were completed. The majority of respondents addressed the following themes related to substantial improvement in their comments: enforcement at the local level, threshold of 50 percent, guidance and dissemination of information, definition of market value, inclusion and exclusion of items in calculating cost of improvement, rewording of definition to include substantial damage and cumulative permit tracking, consistency with building codes and building practices, acceptance of alternative techniques for mitigation, and reliance on objective and
defendable methods in making determinations. The report concludes with commentary on general issues raised in the questionnaires by the respondents.

**Keywords:**
modeling, risk assessment

**Abstract:** A recent report of the Interagency Advisory Committee on Water Data found that there is “no current procedure for assigning an exceedance probability to the probable maximum flood (PMF)...in a reliable, consistent, or credible manner.” This conclusion was used as justification for continuation of the current, quasideterministic, PMF-based spillway design methods used by all federal agencies. This is despite criticism by both researchers and practitioners that PMF-based methods tend to lead to a false sense of security and to misallocation of resources for dam safety improvements. As an alternative to perpetuation of the status quo, the writers outline four general areas in which research should be promoted for improved estimation of extreme floods, as well as research aimed at development of a method for incorporation of risk information into spillway design. The writers believe that if the federal agencies were to promote research in the areas suggested the current stagnation that has set in would be broken, and the self-fulfilling prophecy that there are no alternatives to current practice could no longer be justified.

**Keywords:**
Europe, France, insurance, insurance industry, public policy, risk financing

**Abstract:** The report addresses the consequences of recent catastrophic disaster events for insurers in Europe. It demonstrates how insurers, deprived of reinsurance capacity at an affordable price, could decide to stop covering specific extreme events. The consequences for individuals and firms would be immediate and significant. The solution lies in taking advantage of strengths of government and the insurance industry. Developing public-private partnerships could constitute one of the most appealing ways to solve the problem of financing the consequences of those extreme events. The paper analyzes policy issues related to risk sharing between insurers and a state-backed governmental re-insurer.

**Keywords:**
coastal areas, erosion, insurance coverage, legislation, property values, public policy

**Abstract:** This article reports on proposed federal legislation to limit flood insurance for coastal property at high risk from erosion. The measure has pitted environmental groups against property owners. Environmental groups assert that flood insurance has encouraged destructive and dangerous development on the nation’s shores. Property owners and developers call the proposal a veiled land grab by the federal government. In exchange for continued benefits from flood insurance, the legislation would outline areas prone to erosion where new construction or
substantial improvements would be limited or prohibited. In the areas of imminent erosion, property owners would receive funds to relocate or raze their buildings. If they chose to stay, then they would receive limited benefits and would lose coverage after their next claim. No one can say with certainty how much land or how many buildings the measure would affect. This is because the areas prone to erosion have not been mapped, a process estimated to take at least five years.

- Write Your Own Program

**Abstract:** This report reviews the current structure and activities of FIA, expansion of the WYO Program, geographical distribution of business, costs of the various services, use of servicing carriers in lieu of a Direct Servicing Agent, and other miscellaneous matters. Several observations made in the report warrant further consideration. For example, as of January 1, 1987, 23 states had at least 10,000 policies-in-force. These states comprise 90 percent of the program’s business. With a large number of exposures subject to flooding from hurricanes in the Atlantic and Gulf Coasts, the NFIP needs a better geographic spread of risk. To that end, the author recommends a study to identify geographic areas to target and to consider the steps necessary to write more business in such areas. Another recommendation would involve the elimination of the Direct Servicing Agent and replacing it with one or more insurance companies to service agents not affiliated with a WYO company. Additional observations and recommendations appear in the report.

**Keywords:**
- North Carolina
- property values
- risk perception

**Abstract:** This study estimated a hedonic property price function using floodplain data coupled with extensive property sales records from Pitt County, North Carolina to estimate the effects of flood hazards on residential property values. Using a large data set of 5,122 single-family residential home sales between January 1998 and June 2002, the study found that the market value of a house located within a floodplain is significantly lower than an equivalent house located outside the floodplain. The price differentials range from $5,000 to $11,000 for houses sold between $50,000 and $225,000. Moreover, these price differentials are greater than the present value of the future flood insurance costs. The cost of a house in the floodplain is due to more than the cost of flood insurance. An average house located in a floodplain is discounted by 6.6 percent of the property value, while the capitalized insurance premium value represents approximately 4 percent of the house’s selling price. The discounted value indicates that house buyers perceive substantial non-insurable costs associated with flooding events and location in SFHAs.

Keywords: insurance claims, insurance coverage, liability, NFIP

Abstract: This report provides recommendations to improve the NFIP’s operations by identifying practical changes to the underwriting/rating and claims processes and to FIA’s controls. Although the NFIP’s requirements and controls (and compliance with them) were found to be generally adequate to ensure effective management of the NFIP, and the degree of compliance with NFIP underwriting/rating and claims requirements is adequate, areas for improvement were noted in four major functional categories: operational/communications, underwriting, claim/loss adjusting, and financial reporting/audit. These functional areas correspond to areas in which opportunities for improvements in the process and controls areas were detected.

Keywords: economic modeling, NFIP, risk financing, strategic planning

Abstract: FEMA hired Deloitte & Touche to investigate alternatives to current financing from the Department of the Treasury for the NFIP. This report details the consultant’s findings on risk financing and options for risk transfer, including the identification and interviewing of organizations with relevant option and commercial financing experience. The report discusses the development of a stochastic model using underlying FIA assumptions to simulate the NFIP’s total financing costs over a ten-year period. The total financing activity and stabilization effect (i.e., variability) of the following eight scenarios are reviewed: (a) bank financing; (b) financial reinsurance; (c) catastrophe bonds – interest and principal at risk; (d) catastrophe bonds - interest at risk; (e) program capitalization; (f) funding the premium differential; (g) Treasury financing; and (h) capitalization from congressional appropriations. The document concludes that the first four scenarios, which involve commercial financing activities, add costs to the NFIP’s operations. It also concludes that scenario iii would be the least expensive (99 percent nonexceedence level). The economic value of scenarios i and ii varied depending on the nonexceedence level reviewed. Scenario i was the least expensive at low exceedence levels due to the 100 basis-point fee charged on the unused bank facility. Scenario ii is the least expensive at the mid-exceedence levels. The remaining scenarios include congressional appropriations and assume appropriations are provided on an interest-free basis.

Keywords: buyouts, cost-benefit analysis, Hazard Mitigation Grant Program, mitigation, substantial damage

Abstract: This report summarizes the results of cost-benefit analyses performed on structures declared as substantially damaged under FEMA’s Hazard Mitigation Grant Program (HMGGP). These structures have been exempted from a cost-benefit analysis since FEMA issued a memorandum in late 1996. Cost-benefit analyses were performed for 1,979 acquired structures in all 10 of FEMA’s regions. The analyses show the cost effectiveness of FEMA’s exemption policy for each of FEMA’s 10 regions, with ratios of benefits to costs ranging from 1.06 to 6.10 and averaging 2.21. A supplement to the report details the information and assumptions used to
perform the cost-benefit analyses for the substantially damaged structures, presents the results of a theoretical study of the effect of storm frequency on cost-benefit analysis, and supports the findings of the theoretical study with data from the cost-benefit analyses for the substantially damaged structures.

Keywords: environmental impacts, environmental policy, floodplain management, Florida, legal issues and litigation, subsidies

Abstract: The article describes the arguments of the National Wildlife Federation for protection of the National Key Deer Refuge, home to an endangered subspecies of white-tailed deer in the Florida Keys, from development. In all, 16 endangered species inhabit the area facing development pressure. The controversy over the Key Deer’s habitat has existed for at least 60 years. In the 1950’s, the species population had sunk to an estimated 50 animals, in part because of uncontrolled hunting. Since then, the population has fluctuated, but remains at no more than 300 animals. Most recently, attorneys hired by the conservationists attempted to obtain an injunction to halt construction of a road approved by Monroe County commissioners. The main environmental hazards facing the Key Deer are roads and motor vehicles, mosquito ditches, fragmented habitat, housing developments, and dogs. In the opinion of the author, developers have not faced significant opposition from county commissioners when undertaking development activities harmful to the Key Deer population due to their political clout. The author also criticizes the U.S. Fish and Wildlife Service (FWS) for failing to designate critical habitats for the deer, leaving commissioners without clear guidelines for action. The author cites the struggle of the Key Deer as an illustration of the consequences of weak implementation of the Endangered Species Act. Recently however, several positive developments have encouraged conservationists. The Florida Keys were designated an Area of Critical State Concern, making decisions by county commissioners subject to state scrutiny. The Florida Department of Community Affairs instructed the county to revise a proposed comprehensive plan to account for growth pressures. Finally, the National Wildlife Federation won a 1994 court case against FEMA for failing to consult with FWS to determine whether subsidies by the NFIP encouraged development that might harm deer.

Keywords: attitudes, mitigation, public policy, risk communication

Abstract: A model of administrative decision making in local communities is tested for the case of land-use and building regulations implemented to mitigate flood risks. This model implies that the extent of the problem in the community causes local decision makers to perceive the problem as being serious, this then causes appropriate decisions to be made to alleviate the problem. Multiple regression analysis of flood data from the Red Cross and interviews with 432 mayors and council members in 100 local communities shows that the extent of the flood problem in local communities has positive effects on the officials’ perceptions of the extent and seriousness
of the local flood problem. However, these factors have little effect on the officials’ attitudes toward policies affecting the mitigation of flood risks.

**Keywords:**
Australia, cost-benefit analysis, economic impacts, mitigation

**Abstract:** This working group examined the realized economic benefits of flood mitigation activities with a literature review, consultations with key planners, and case studies of areas with repeated past flooding. The case studies examined individual mitigation measures (land use planning, voluntary purchase, building controls, sealed roads, and levees) in specific locales and yielded quantitative data to suggest Australia’s various flood mitigation measures created substantial, tangible savings. The report includes dollar amounts for each measure in each locale. At the same time, the enumerated savings reported are likely to underestimate the full benefit of flood mitigation because intangible savings (like reduced stress) cannot be quantified. More broadly, the report identified a number of important points related to the benefits of mitigation: there is a trend toward nonstructural mitigation solutions; levees appear to have been effective in preventing substantial damage; altering the way infrastructure is designed and constructed can be very cost-effective; mitigation solutions must be tailored to their location in order to be successful; community awareness and preparedness play an important role in determining the success of mitigation; equity and perceived fairness are powerful factors in community acceptance; and finally that drainage and storm water issues are closely linked to other flood issues, regardless of the source of flooding (e.g., storm surge or cyclones).

**Keywords:**
environmental protection, hydrology and hydraulics, wetlands

**Abstract:** The traditional methods and procedures used by hydrologists and hydraulic engineers to define floodways and floodway fringe areas are changed so that designated floodways are adjusted to encompass wetlands, resulting in better protection of the nation’s diminishing wetlands and a reduction in development problems due to permit requirements pursuant to Section 404 of the Clean Water Act. Hydrologic studies to define floodways and floodway fringe areas are an important tool in the management of floodplains. A minimum standard for defining floodways has been developed under the NFIP. Implementation of more stringent standards is a local community decision. By proposing the inclusion of wetlands in the determination of designated floodways, hydrologists and hydraulic engineers have an opportunity to contribute to the protection of wetlands and to assist in better defining floodway fringe areas available for development.

**Keywords:**
climate change, insurance industry, public policy

**Abstract:** The presentation compares insurance schemes in various European countries and the United States, assesses their strengths and weaknesses, and outlines options for both the insurance industry and floodplain management. Current arrangements vary widely between countries. In France for instance, flood insurance is provided by the government, but administered by the private market and activated only in the case of official disasters. The author sees the strength of flood insurance to be the efficient transfer of risk and the involvement of many public and private sectors parties. However, he points out that 80 percent of flood losses are uninsured, and the poor and those agricultural owners have little or no access to the flood insurance market. The author also sees climate change as having a drastic, long-term effect on the magnitude and variability of flood disasters, with implications for flood risk. The author favors an approach that emphasizes collaboration and layers of protection from flood risk.

**Keywords:** economic modeling, housing markets, property values

**Abstract:** The effects of a floodplain location on the market value for property are controversial, with the conventional wisdom being that buyers are myopic. Previous statistical tests have proven inconclusive in deciding the issue. Herein, a theoretical model, that of hedonic price indexes, is posited and tested, using housing sales characteristics data obtained from a Multiple Listing Service. This study suggests that home buyers do adjust the purchase price for houses within a floodplain, and this amounts to, on average, just over 12 percent. The data come from a small town in the Midwest where the last severe flooding occurred a decade ago.

**Keywords**

communication, risk assessment

**Abstract:** The United States began structural flood measures in the 1950s and added complementary nonstructural measures in the 1950s. Nevertheless, national flood damage totals continue to increase. Reversal of this trend will require better communication among regulatory agencies, experts assessing risk, and floodplain occupants. Modern technology provides tools to measure specific risks and communicate the hazards of property loss and personal dangers to individuals able to reduce the losses. One problem with the existing communication, based on a safety standard tied to the 1 percent annual chance floodplain, is that some locations in the 1 percent annual chance floodplain are subject to only trivial damage by shallow flooding, while other locations outside that boundary are subject to major devastation and threats of drowning by floods that could be as common as the true 25-year event. Systematic estimation and dissemination of the risk of economic loss can reduce flood losses, vary community programs with the hazard to life and property, and help every floodplain occupant accommodate more effectively with his site-specific problem.

**Keywords:**
disaster assistance, public policy

**Abstract:** Federal disaster assistance is one component of U.S. policy for coping with damaging floods. The president ultimately determines whether federal relief is provided to states and local communities following a disaster, yet guidelines governing the president’s discretion are vague and the total federal cost of disaster assistance is difficult to determine. This study analyzes flood-related presidential disaster declarations from 1965 to 1997. It compares the annual number of flood-related declarations to measures of precipitation and flood damage, finding that presidents have differed significantly in disaster declaration policy. Annual differences in declarations during seven presidential administrations do not correspond to the president’s political party affiliation. In addition, a state’s ability to pay has not been a major consideration in presidential decisions about whether a disaster warrants federal assistance. However, presidential decisions are related to whether the president is running for reelection. Declarations are also related to changes in legislative and administrative policy. This article discusses the significance of these findings in the context of national policies governing floods and other disasters.

**Keywords:** Florida, Hurricane Andrew, media, risk communication, risk perception

**Abstract:** Residents of South Florida who experienced Hurricane Andrew evaluated the credibility of the hurricane-related information from television as more trustworthy than that from other sources. Contrary to what was hypothesized, the broadcast medium of television (but not radio) was evaluated on the dimension of expertise as being higher than newspapers. As predicted, interpersonal sources were judged high on trustworthiness, but much lower on expertise than any of the mass media sources. The findings indicate that when people wanted factual information and self-help information, they expressed reservations about the credibility of other people (friends, neighbors, or relatives). In such cases, there was a marked tendency to place emphasis (or faith) in television.

**Keywords:** coastal areas, erosion, risk communication

**Abstract:** This article discusses the risk to property in the United States from coastal erosion. Coastal erosion caused by rising sea levels, large storms, and powerful ocean waves is wearing away the 10,000 miles of shoreline along U.S. oceans and the Great Lakes and could destroy 85,000 houses over the next 60 years. In March, the H. John Heinz III Center for Science, Economics, and the Environment completed a nationwide study of the effect of erosion on the NFIP and other federal programs and on coastal communities. The findings suggest that property owners must be informed of the erosion risks that they face. Furthermore, erosion risk must be included in local land-use planning, state coastal management, and private and public lending and insurance practices.

Keywords:
compliance, elevation certificates, enforcement, insurance, insurance premiums, risk management, risk perception

Abstract:
Nearly 30 years since its inception, the NFIP has experienced a relatively low level of compliance and a high level of recurring problems. This report recommends the implementation of a program by FEMA and the states to collect and inventory data in order to establish compliance with the NFIP and reduce losses in flood-prone communities. Specifically, the program would involve the use of complete, current, and accurate elevation certificates on all buildings in a Special Flood Hazard Area (SFHA). An accurate and certified elevation certificate can indicate whether a community is correctly applying its ordinance and is complying with the NFIP. Furthermore, an accurate and certified elevation certificate explains the risk associated with the building so that it may be actuarially rated. The ultimate goal is for a building’s insurance rate to be commensurate with its risk. In order to achieve this goal, FEMA and the NFIP must reprioritize their resources by placing new emphasis on defining risk on a building-by-building basis. In addition, the proposed program of elevation certificates will allow FEMA to identify where compliance problems exist and to solve those problems with relevant training. Attached to the report is a draft of a study on Expedient Elevation Certificates of pre-FIRM houses in Louisville and Jefferson County, KY, prepared by Dewberry & Davis.

Keywords:
geographic information systems, Hurricane Fran, North Carolina

Abstract: The report presents Hurricane Fran in North Carolina as a successful case study of the use of GIS in a disaster management operation. Hurricane Fran hit the North Carolina coastline in September 1996, causing close to $4 billion in damages. Previous research has found that many emergency managers did not accept the use of GIS during Hurricane Andrew. GIS maps were used to show the historic extent of hurricane storm surge inundation for coastal counties in North Carolina and lands susceptible to flood inundation according to the severity of different hurricane categories. In the disaster field office, first responders, federal agencies, and the emergency community at large used GIS to monitor and report weather conditions, physical conditions, such as debris removal, and population conditions. GIS was also crucial to matching georeferenced addresses of people requesting funds for repairs to DFIRMs representing NFIP zones and coverage to determine the eligibility of those applying for NFIP funds. The report concludes that federal and state agencies have accepted the use of GIS since Hurricane Andrew and that the use of GIS has facilitated the efficient dissemination and coordination of field information.

Keywords:
agency operations and management, federal programs

Abstract: FEMA has won widespread praise for its reinvention efforts. Lawmakers who once talked of abolishing the agency now compliment it. The results of specific measures also highlight the agency’s success. For example, in fiscal 1998, FEMA took an average of 8 days to get relief checks to disaster victims, down from 10 days in 1997 and a high of 20 days in 1992. Enforcement of the NFIP’s building standards prevents flood losses of $750 million annually. This document discusses FEMA’s organization and operations and how the agency undertook initiatives to better serve its customers. A careful analysis reveals that no single variable explains FEMA’s success. Rather, the agency improved its results through a collection of different but related management reforms. The agency did a number of things right at the same time, and the results for the whole exceeded the sum of the parts.

Florida, Hurricane Opal, media, risk communication, risk perception

Abstract: Although researchers and practitioners have been using the Internet to communicate information on disasters, few systematic studies have assessed the type of information that is or should be communicated via this medium. This paper presents an exploratory, yet systematic, study of FEMA’s coverage of the 1995 hurricane season via e-mail and the Internet. An overview analysis of the 1995 season shows that FEMA distributed 184 e-mail messages of which 138 were hurricane-related and 46 were nonhurricane-related. Following this overview analysis, a case study is presented of FEMA’s coverage of Hurricane Opal, which was associated with significant impacts in Florida. The focus of analysis in the case study is a type of e-mail message called the situation report (sitrep), which FEMA used to communicate information on disasters. The number, timing, and content of sitreps that FEMA issued for Hurricane Opal are analyzed and the results used to discuss the agency's communication efforts via the Internet.

Australia, flood causes, floodplain management

Abstract: The guide is one of four Flood Guides sponsored by Emergency Management Australia to improve Australia’s reaction to flood hazard. The goal of this guide is to foster better integration of the floodplain management planning process and the flood emergency planning process. In particular, the Guide aims to acquaint personnel from local government, emergency service agencies, and other agencies with opportunities to contribute to and obtain useful
information from the floodplain management planning process. This guide presents a variety of principles and practices concerning our current knowledge and understanding of how best to undertake floodplain management in Australia.

disaster planning, England, flood control, risk communication, structural approaches,

**Abstract:** The report evaluates the reaction of the Environment Agency (EA) to the autumn 2000 floods, which affected 10,000 properties at 700 different locations, with a total cost of £1 billion. The floods challenged the adequacy of existing building standards and demonstrated the need for improved coordination and increased contingency planning. Also, the public was confused by organizations responsible for different sources of flooding, such as surface water sewers, streams, and rivers, and needed a single source of reliable information. However, EA has made advances in flood forecasting, warning, and response. For instance, 280,000 properties benefited from structural flood mitigation, and an emergency effort to distribute sandbags protected another 37,000 properties. The report recommends EA consolidate flood warning messages into a single EA hotline, expand the ways in which to warn property owners in high-risk areas, engage in comprehensive disaster contingency planning, and increase investment in structural mitigation.

England, floodplain designation, floodplain management, public policy

**Abstract:** Following the 1998 floods in England, the Agriculture Committee issued a report entitled *Flood and Coastal Defence* in which it made a number of recommendations about floodplain development, particularly that “clear presumption should be made against future developments in flood plain plan where the flooding risk attached to a particular development (as determined by the Environment Agency) is deemed to outweigh the benefits.” In response to this report, the Environment, Transport and Regional Affairs Committee strongly supported the minister’s proposal that building on the functional flood plain should be avoided. The report’s recommendation for the final report is that it should indicate clearly the thresholds which will determine the choice of one or another planning response. The most stringent planning response should stipulate that no facilities for emergency services be permitted in the floodplain and that only exceptional development should be allowed in the floodplain.

environmental policy, Europe, flood causes, mitigation, public policy
Abstract: During the 25-year period between 1971 and 1995, there were 154 major floods in Europe, and in 1996 alone there were nine flooding events. This report presents an overview of the main natural and artificial causes and impacts of extreme hydrological events, such as floods and droughts, in European countries. Flooding and its impacts are often influenced by a combination of natural factors and human interference. The main driving forces (pressures) that induce or intensify floods and their impacts include climate change, land sealing, changes in the use of catchments and floodplains, population growth, urbanization and increasing settlement, roads and railways, and hydraulic engineering measures. In addition to a discussion of these aforementioned pressures, the European Environment Agency (EEA) reviews recent floods in Europe and the structural and nonstructural responses to those floods. An appendix details specific examples of flood prevention and alleviation measures applied in Europe. The report also discusses the driving forces, pressures, impacts, and responses concerning droughts.

Keywords: compliance, development, floodplain management, insurance, NFIP, public policy

Abstract: After 30 years, is the NFIP fulfilling its dual missions of promoting positive decisions regarding land use and of reducing the overall public portion of recovery costs due to flooding? This evaluation examined 36 studies and reports published between 1976 and 1998, which explored the relationship between floodplain development and insurance availability. The studies, which often reach contradictory conclusions, represent products of various disciplines—law, geography, sociology, and economics. None of the studies offers irrefutable evidence that the availability of flood insurance is a primary factor in floodplain development. Neither does the empirical evidence lend itself to the opposite conclusion. Taken as a whole, several themes emerge. For example, while the NFIP may not represent the primary cause of development in environmentally sensitive areas, the program does little to discourage development. Based on her review and analysis of the literature, the author recommends a comprehensive evaluation of the NFIP and a consideration of the program’s central questions in the larger context of public policy.

NOTE: This article is adapted from a 1999 report National Flood Insurance Program: Issues Assessment, which also appears in the bibliography.

Keywords: NFIP, development, floodplain management

Abstract: This article reviews and summarizes 36 studies that assess whether the NFIP has influenced development in floodplains. The author provides an historical perspective of the NFIP, lists factors to be considered about the program, and identifies the consequences of outlawing federal insurance for units of the Coastal Barrier Resources System. Overall, the literature reviewed provides insufficient empirical evidence to support the popular belief that the NFIP is a primary factor in floodplain development today and does not lend itself to the opposite conclusion either.

Keywords: awareness, England, insurance industry, property values

Abstract:
Severe flooding throughout England in 1998 and 2000 saw an increase in the extent of flood prone areas, and the levels of flood damage. The increased cost of flooding has caused concern among residential insurance and housing finance industries, as well as property appraisal and leasing agency professionals. The report presents the results of a survey to determine the degree of flooding, the effect of flooding on residential property values, the impact of flooding on building insurance premiums and obstacles to financing property in flood prone areas. There are currently two million residential, commercial and rural properties in England in flood prone areas. More than 50 percent of residents of flood prone areas are unaware that their property may be threatened by flooding. Among the prospective homeowner, the chartered surveyor, and the financier, the prospective homeowner is the least likely party to consider the affect of flooding when purchasing a property in a flood prone area. As a result of the 2000 floods in England, residential property exposed to the flood hazard experienced a decline in value. However, the amount of the decline varied by community. In areas where flood insurance was difficult to obtain, the impact on residential values was more significant than in those areas in which it was easy to obtain.

Keywords: Australia, housing markets, property values

Abstract: The study analyzes residential property sales in flood prone areas and compares prices between 1984 and 2000 with similar properties in immediately adjacent areas not affected by flooding. Similar to earlier studies, the study found that flood prone properties have less value than similar properties that are not flood prone. However, the difference in price was not constant over the 17-year period, but varied depending on how recently flooding had occurred: the difference in housing price was found to be greatest following a period of heavy flooding, and tended to diminish when flooding had been minimal. The study also found that in periods of strong or weak property markets, the percentage increases in prices were similar for flood prone and non-flood prone properties alike.

Keywords: floodplain management

Abstract: The document contains the proceedings of the conference Watershed '96, with approximately 2,000 participants from public education, government, state and local groups, public and privately owned utilities, environmental groups, researchers, public policy experts, and more. The program included eight technical workshops to educate watershed professionals, a
watershed festival that highlighted 30 activities that might be adapted for local festivals, an education symposium targeting the interests of both the professional and the public, and a series of stakeholder workshops that helped participants identify, prioritize, negotiate, and resolve a range of issues related to watershed management. Eighty technical sessions involving over 340 speakers provided comprehensive technical information on the watershed approach, economic and social considerations, decision-making and management regimes, and watershed enhancement tools. The conference also included discussions with presenters, poster sessions, and a technology demonstration area. Field trips examined many local watershed efforts up-close at various locations including the Patuxent River Watershed, Chesapeake Farms Sustainable Agricultural Project, Kenilworth March Restoration, and Alexandria, Virginia’s Delaware Sand Filter, Underground Sand Filter, and Bio-Retention Filters.

Keywords: development, economic impacts, environmental policy, floodplain management, Midwest floods of 1993, mitigation, public policy, risk communication
Abstract: Flooding is a natural hydrologic occurrence, but flood-related damage to property and the risks to human life are exacerbated by urban growth and other intensive development in floodplains. The conventional response has been to construct ever-larger flood control systems, but floodplains are not fixed and they defy simply structural solutions. This report summarizes key points from a conference of policy experts and local elected officials to draw land-related lessons from the disastrous experience of flooding. The report considers ecological, economic, and legal issues of land use in floodplains through case studies of local responses to the disastrous 1993 floods in the Midwest, as well as other river basin management programs around the country.

Keywords: environmental restoration, Midwest floods of 1993, Mississippi River, riverine areas
Abstract: Largely the result of hydrologic alterations, the upper Mississippi River basin has become destabilized and is no longer physically compatible with its climate. The river is experiencing higher and more frequent flood stages and lower flows during dry seasons. The result is an unpredictable river that can flood farmhouses miles from its normal channels during floods and render barges marooned during droughts. Due to the Midwest floods of 1993, the opportunity is in hand to reverse current watershed management and restore some of the natural conditions that made the Mississippi River an unusually rich ecosystem. This article considers the policy implications of these floods focusing on changing the funding priorities on the federal level to favor programs that enhance the ability of the landscape to retain and filter water with their floodplains and programs that provide technical and financial assistance to landowners for wetland restoration.

**Keywords:**
Hurricane Hugo, risk communication, risk perception, South Carolina

**Abstract:** This article studies the impact of disaster education on hurricane preparedness among residents in Charleston, SC. The article examines: (a) the impact of participation in disaster education programs generally; (b) the impact of hurricane experience as a type of education; and (c) the impact of participation in earthquake specific education programs to determine whether there is any transference of knowledge across agent types. Two indices of preparedness are used: household planning activities and adaptive response activities. Participation in some type of disaster education program was strongly related to the preparedness measures. Hurricane experience had some minimal effect on adaptive response but not on household planning. Participation in the earthquake specific education programs was not a significant predictor when controlling for other variables.

**Keywords:**
economic impacts, floodproofing, Pennsylvania

**Abstract:** The report examines the costs of floodproofing a new commercial building in Jersey Shore, PA, and concludes that floodproofing is not unduly costly. The study evaluated three potential floodproofing solutions – building raised on fill, building raised on columns, and building raised on fill with watertight enclosures – ranging in cost from $35,912 to $89,732. Floodproofing increased the cost of construction between 6 and 16 percent. By calculating the present value of the reduction in insurance premium over 20 years, the study was able to obtain benefit/cost ratios for each of the three floodproofing solutions. The benefit-cost ratios were 5.96 for building raised on fill, 2.48 for building raised on columns, and 2.31 for the building that combined fill and watertight enclosures. Benefits were also estimated through the reduction in flood losses. Average annual flood losses – estimated at $13,834 prior to floodproofing – were reduced by from 85 to 92 percent through floodproofing solutions. The reduced need for federal flood disaster relief was not included in calculations. Findings from this case study can hopefully be approximated to the nation and provide solid evidence of the feasibility of floodproofing.

**Keywords:**
Base Flood Elevation, compliance, development, enforcement, floodplain management, floodway, mapping, mobile homes, permits

**Abstract:** The purpose of the floodway is to reserve the central part of the floodplain, to ensure that some part of the floodplain will remain open to carry floodwaters efficiently. Floodway regulations are one of the most complex aspects of the NFIP. This guidebook is designed to provide community officials with an explanation of the floodway and provide guidance for regulating the floodway. Specific topics include the use of a Flood Boundary – Floodway Map, role of the development permit, evaluation of the permit, regulation of mobile homes in the floodway, and regulation of existing structures in the floodway.

**Keywords:**
economic impacts, enforcement, environmental impacts, substantial improvement

**Abstract:** This study estimated the magnitude of activity related to substantial improvement and to examine the effectiveness of the regulatory approach under the NFIP in reducing flood risk to existing property. The study concludes that the magnitude of substantial improvement is quite small in relation to the magnitude of new construction. Vigorous enforcement of the NFIP’s substantial improvement regulations, therefore, will not have as significant an effect, in terms of overall reduction of flood damage, as will application of the NFIP’s regulations for new construction. The study also concludes that for a variety of reasons, participating communities have not enforced substantial improvement regulations in regard to non damage-related improvements. This conclusion raises questions about using a regulation to reduce the potential flood damage of existing structures.

**Keywords:**
Base Flood Elevation, building codes, coastal areas, cost-benefit analysis, Hurricane Frederic

**Abstract:** Prior to Hurricane Frederic, the NFIP required new construction in coastal high hazard areas to be elevated with the lowest floor at or above the storm surge stillwater level. Damage to new construction during Frederic led to an evaluation of elevating the lowest floor to the wave crest level. The engineering and economic analyses concluded that elevating a new house to the wave crest level associated with 1 percent annual chance flood storm surge reduces both flood loss potential and flood insurance premiums, each of which more than offsets the added costs to elevate to that height.

**Keywords:**
buyouts, federal programs, mitigation, Section 1362

**Abstract:** This study focuses principally on Section 1362 (a) of the National Flood Insurance Act, undertaking to 1) identify and explore alternative means for its implementation; 2) estimate the number of structures potentially eligible for purchase under it; 3) identify the effects of Section 1362 on individuals and communities; 4) identify its relation to other federal policies and programs; and 5) estimate the federal costs associated with the purchase of flooded properties. Acquisition under Section 1362 can assist communities to achieve their comprehensive community development goals, while simultaneously making wise use of their floodplains, correcting past mistakes in development, as well as reducing losses from floods. It is estimated that the number of properties that will become eligible and available for acquisition through Section 1362 will rise from 1,600 in 1981 to about 2,000 in 2000. In 1979 dollars the federal cost of purchasing these properties would rise from $21 to $27 million. The program should be carried out in close cooperation with states and local communities and, for greatest effectiveness, should be closely coordinated with related federal programs. (Note: the National Flood Insurance
Reform Act of 1994 repealed Section 1362 and replaced it with Section 1366, which established the current Flood Mitigation Assistance (FMA) Program.)

Keywords: building codes, coastal areas, dams, development, floodplain management, insurance, insurance claims, levees, mitigation, nonstructural approaches, structural approaches

Abstract: This third annual conference addressed the expanding role of states in implementing the floodplain management policies of the NFIP. In keeping with the theme “New State and Federal Directions in the Evolving Flood Program,” the conference endeavored to convey FEMA’s concept of the current state of the program as responsibilities devolve from the federal to the state level. The plenary sessions and workshops addressed such varied topics as the recent accomplishments and future direction of the State and Local Programs Directorate and FIA, coastal issues, interstate sharing of personnel during flood disasters, floodplain management in rural areas, and how insurance and hazard mitigation complement each other. For example, participants in the workshop on floodplain management in rural areas discussed the fact that rural communities have a high percentage of unnumbered A Zones that need to be determined for purposes of floodplain management. This publication presents the minutes or summaries, in various forms, of the addresses from the plenary sessions and workshops.

Keywords: federal programs, legislation, NFIP

Abstract: This publication presents an update of the consolidated laws governing all aspects of the NFIP. The document covers the program responsibilities of both FIA (insurance) and the State and Local Programs and Support Directorate (floodplain management and engineering).

Keywords: compliance, federal programs, floodplain management, 1 percent annual chance flood standard

Abstract: In 1982, the Office of Management and Budget (OMB) directed FEMA to investigate whether federal agencies are complying with the requirements of Executive Order 11988 and determine what impact the order is having on the level of federal support in SFHAs and to review the use of the 1 percent annual chance flood standard used in implementing the order and other federal flood hazard reduction programs. This report presents a historical overview of the need for and development of a national flood hazard reduction program and a standard for implementing that program, the findings of the review of the 1 percent annual chance flood standard and EO 11988, and FEMA’s conclusions and recommendations based upon that review. For example, FEMA concludes that the 1 percent annual chance -year flood standard is strongly supported and being applied successfully by all levels of government and recommends that the standard be retained. With regards to EO 11988, FEMA finds that implementation procedures have not been adopted by all agencies and some agencies have adopted procedures inconsistent
with the order. FEMA recommends that these agencies with inconsistent implementation procedures should bring those into full compliance.

**Keywords:**
federal programs, flood causes, flood control, Mississippi, Missouri, mitigation, NFIP, Oklahoma, ports, public policy

**Abstract:** This study examines the relationship between the objectives of the NFIP and Executive Order (EO) 11988 and the need for the development of inland ports. The central issue investigated is that some structural components of river ports and terminals require siting within the floodplain in order for the port to function (i.e., functional dependence). The study is based on the collection and analysis of available data pertaining to legislation, flood insurance, flood losses, inland ports and their operations, mitigation, economics, and hydraulics, and both perceived and experienced conflicts. Furthermore, consultation with FEMA resulted in the selection of the ports of St. Louis, MO; Tulsa, OK; and Greenville, MS, as case studies. Several conclusions and recommendations emerge from the analysis. For example, the objectives of the NFIP and EO 11988 and the economic need for the development of facilities for inland ports are compatible. Numerous areas of potential conflict exist between the NFIP and the development of ports. These arise for the jurisdictional and administrative complexity of managing inland waterways, the competition for limited resources from the floodplain, the demonstrated functional need of some port-related activities on proximity to water, and the complexity of the regulatory process itself.

**Keywords:**
flood insurance studies, mapping

**Abstract:** The Committee on Flood Insurance Studies Research of the National Research Council’s Advisory Board on the Built Environment reviewed the NFIP’s operations and concluded that considerable progress has been made but that there exist many operational concerns related to the need for: (a) continuation of flood insurance studies and mapping in areas not yet studied; (b) restudy of areas previously studied; (c) improved flood insurance study products; and (d) more economical and efficient methods for the preparation of flood insurance studies and restudies.

**FEMA. (1986). *Closed-Basin Lake Flooding: Case Studies and Mitigation Opportunities*. Denver, CO: FEMA Region VIII.**

**Keywords:**
California, closed-basin lake flooding, hazard identification, mapping, Minnesota, mitigation, North Dakota, Oregon, Utah

**Abstract:** The disaster declarations of 1983 and 1984 in Utah introduced FEMA Region VIII to the problems posed by closed-basin lakes. In the summer of 1985, FEMA Region VIII began an investigation of the causes, effects, and approaches to mitigating the problems caused by lakes with inadequate or no outlets. The region selected the best known and documented cases for analysis including Lake Pulaski, MN; the Great Salt Lake, UT; Devils Lake, ND; Lake Elsinore, CA; the Salton Sea, CA; and Malheur Lake, OR. Lake flooding poses problems across the
nation—not solely to the West. Without a concerted management effort, losses attributable to closed-basin lakes will likely exceed $1 billion by 2000. Most important, successful mitigation programs have been developed and appear to be transferable. Recommendations are made for follow-up through a joint effort of FEMA Region VIII and the Association of State Floodplain Managers. The recommendations involve 1) continuing research into the most effective ways to identify the lake-rise hazard and mitigate its effects, especially as the lake is rising, but before serious damages occur; 2) determining the relationship between long-term climatic variations and lake-rises; 3) selecting additional case studies for analysis; and 4) assisting local decision-makers in addressing lake-rise issues.

Keywords: compliance, enforcement, floodplain management

Abstract: This manual provides guidance to FEMA personnel involved in ensuring that participating communities are administering their flood loss reduction programs in compliance with NFIP criteria. It offers procedures for taking enforcement actions against noncompliant participating communities as well as noncompliant individual structures.

Keywords: communication, lending institutions, Maine, mandatory purchase

Abstract: On April 9, 1987, the President declared a disaster as the result of severe flooding in Maine. Following this declaration, 2,332 disaster victims applied for disaster assistance through FEMA Region I’s Disaster Assistance Program Division. Out of this total number, 613 applications came from personal or commercial properties located in Special Flood Hazard Areas (SFHA). After paring down the sample, FEMA examined 94 properties and found that only 12 of them had flood insurance at the time of mortgage closing. FEMA cites the following reasons for lender noncompliance based on its analysis: 1) human error on the part of the lender when reading the FIRM; 2) legitimate differences in interpretation of the FIRM for borderline properties; 3) the lender opted not to require flood insurance for borderline properties out of consideration for the limited income of some of the property owners; 4) ignorance on the part of lender concerning the flood insurance purchase requirements; 5) the lender ignored the flood insurance purchase requirements; and 6) a lack of follow-up enforcement by the lender when policies expired. Furthermore, FEMA makes several policy proposals to improve lender compliance which include: 1) requiring property owners to provide mortgage information when they apply for disaster assistance; 2) widening NFIP’s information loop; 3) targeting lenders for participation in the Lender Workshop Program; 4) incorporating a “Lender Education Visit” into Community Assessment Visits; and 5) regularly updating, publishing, and distributing Community Status Lists.

Keywords:
This report addresses the impacts of an NFIP regulation that requires a manufactured home placed in an existing manufactured home park or subdivision be elevated to or above the 1 percent annual chance flood elevation to reduce damages from flood and threats to public safety. Prior to October 1, 1986, these manufactured homes had been exempt from this requirement. The report evaluates alternatives to this requirement that would achieve the same purposes, but with lesser impacts on the manufactured home community. Based on the evaluation, FEMA selected an alternative that would 1) end the “grandfathering of new and replacement units in existing parks at the conclusion of a ten-year transition period (October 1, 1999); 2) during the transition period, require elevation of units placed on sites on which a manufactured home has been substantially damaged by a flood; 3) during the transition period, require development of evacuation plans for each existing flood-prone manufactured home park; 4) encourage communities to implement additional measures to reduce flood risks in existing parks through the deducting of insurance premiums; and 5) revise the definition of “manufactured home” to allow communities the option of excluding recreational vehicles, which are fully licensed and highway ready or which are on site for less than 180 consecutive days. FEMA projects this alternative will likely impact existing parks subject to the most frequent and/or severe flooding.

Assistance Visits (CAVs) under the NFIP’s Community Assistance Program (CAP). The major objective of the NFIP’s CAP is to ensure that communities participating are achieving the program’s objectives for the reduction of flood losses. FEMA uses CACs and CAVs to identify floodplain management issues and opportunities to assist communities’ management of their floodplains.

**Keywords:**
agency operations and management, flood insurance studies, mapping, strategic planning

**Abstract:** Historically, FIA has relied on the (flood insurance) restudy, map revisions, and map amendments to ensure that the data in studies and maps are up to date and that the studies and maps accurately reflect existing flood hazards. In preparation for entering the maintenance phase of the NFIP, the Office of Risk Assessment (ORA) has assessed future requirements for flood insurance restudies (RFISs) and for map revisions and amendments. From that assessment, ORA has developed a transition plan that will allow FIA to meet the needs of the maintenance phase of the NFIP through a smooth transition from the phase of initial studies. The plan consists of balancing the personnel and financial requirements for the transitional activities. By Fiscal Year 1996, ORA estimates the budget for flood studies and mapping will stabilize at $26.5 million, a figure that is $10 million less than the current budget. Using historical statistics and empirical models, ORA has estimated the number of RFISs, revisions, and amendments that FIA must process under the full maintenance phase of the NFIP, which will begin in Fiscal Year 1992. The projected yearly totals for the various maintenance activities are 120 RFISs, 60 existing restudies of data, 210 Limited Map Maintenance Program (LMMP) revisions, 165 appellant-initiated physical map revisions, 1,740 Letters of Map Revision, and 455 Letters of Map Amendment. Furthermore, the total number of contractors required once the maintenance phase has fully begun is expected to decrease from 166 in Fiscal Year 1988 to 102 in Fiscal Year 1992.

**Keywords:**
building codes, compliance, enforcement, permits, property values, substantial damage, substantial improvement, zoning

**Abstract:** The enforcement of the substantial improvement requirement as defined in the NFIP regulations (44 Code of Federal Regulations, 59.1) frequently becomes a major concern for local officials after a community has experienced serious damages as a result of a flood or other disaster. In particular, community officials ask many questions concerning permits issued for the repair of damaged structures. The purpose of this document is to answer many of the questions regarding FEMA regulations and policy on substantial improvement as it applies to damaged structures. The questions and answers in this booklet should serve as guidance for local building inspectors, zoning administrators, and other permit officials that enforce the floodplain management requirements of a community participating in the NFIP.

**Keywords:**
history, legislation, NFIP

Abstract: This document contains a comprehensive but concise chronology of significant events affecting the NFIP. Events appear briefly summarized in the document by month and year of occurrence. The chronology covers events beginning with the passage of the Federal Flood Insurance Act in August 1956 through the initiation of the Mortgage Portfolio Protection Program (MPPP) in January 1991.

Keywords: agency operations and management, floodplain management, mapping

Abstract: The Flood Risk Directory (FRID) represents a powerful information tool, providing the linkage between addresses and FIRMs. The benefits of FRID’s applications, both internal and external to FEMA, can be expected to far exceed the costs associated with the production of the system. Among the major benefits of FRID will be its application as a marketing tool. These applications will, for the first time, allow FIA to identify properties at risk from flooding but which do not have a flood insurance policy. This report, while set in the general framework of the conversion of the NFIP’s mapping and engineering to an automated format, focuses on the costs, benefits, and applications of FRID. The following applications of FRID are discussed in the report: processing of Letters of Map Amendment for single lots, risk inspection program, rating and actuarial functions, grandfathering, analysis of data on repetitive losses, marketing, CAVs and CACs, insurance agents, CRS, disaster assistance and disaster field offices, and regional offices. The Office of Risk Assessment (ORA) proposes to move ahead with the development of approximately 20 FRIDs during Fiscal Year 1992. Prior to the end of Fiscal Year 1992, ORA will reevaluate the practicality and utility of FRIDs for the applications discussed in the report and will then, based on the reevaluation, make a recommendation to FIA’s Policy Committee to continue or abandon the production of FRIDs.

Keywords: climate change, coastal areas, environmental impacts, floodplain management, insurance, mapping, 1 percent annual chance flood standard, sea-level rise

Abstract: This report contains the findings and conclusions concerning how a rise in relative sea level would impact the NFIP. Based on information recently released by the United Nations on the range in the magnitude of potential rise in sea level, the report examines two primary scenarios: a 1-foot and a 3-foot increase by 2100. Under both scenarios, the elevation of the 1 percent annual chance flood would be expected to increase by the amount of the change in sea level. Estimates indicate the area inundated by the 1 percent annual chance flood would be expected to increase by the amount of the change in sea level. The region most significantly affected would be the Louisiana coast, where subsidence rates of 3 feet per century would compound the impact of global changes in sea level. Assuming current trends of development continue, the increase in the expected annual flood damage by 2100 for a representative insured property subject to sea level rise is estimated to increase by 36-58 percent for a 1-foot rise, and by 102-200 percent for a 3-foot rise in sea level. Given the possibility for significant impacts of sea level rise in the long term, the report recommends that FEMA should 1) continue to monitor progress in the scientific
community regarding projections of future changes in sea level and consider future studies on potential impacts to the NFIP; 2) consider the formulation and implementation of measures that would reduce the impact of relative rise in sea level along the Louisiana coast; and 3) strengthen efforts to monitor development trends and incentives of the CRS that encourages measures which mitigate the impacts of sea level rise.

agency operations and management, communication, mapping, risk communication

**Abstract:** The OIG conducted this audit to determine the efficiency and effectiveness of FIA’s flood mapping activities. These activities include the 1) process for determining where to conduct restudies; 2) preparation of map information; and 3) distribution of maps and map changes. Findings from the audit suggest that FIA can improve the cost efficiency and cost effectiveness in developing data on flood risks, preparing map information, and providing this information to users. One problem encountered during the audit concerns FIA not receiving the most benefit from its selection of maps to restudy. A FIA policy requires regional offices to compute a benefit cost (B/C) ratio for each candidate to restudy and then rank each candidate based on its ratio. Generally, the regional offices have not followed the criteria to rank B/C ratios. The OIG recommends FIA reassess the policy for ranking priorities to ensure the restudy of areas with greatest need and monitor compliance with the restudy policy at headquarters. The audit also revealed that map users are not always aware of changes made to flood maps. This can result in erroneous flood zone determinations and incorrectly underwritten flood insurance policies. FIA did not publish over 10,200 map amendments made between 1984 and January 1992. FIA has an obligation to publish current flood data, regardless of whether it includes or excludes structures. Recognizing this obligation, the OIG recommends that FIA publicize the availability of the data on amendments already developed and prepare a plan to provide data on amendments on a regular basis.

**Keywords:**
floodplain designation, insurance coverage, lending institutions, mandatory purchase, Write Your Own Program

**Abstract:** This report presents the results of an audit of the Mortgage Portfolio Protection Program (MPPP). FIA created the MPPP in January 1991 to provide mortgage lending and servicing companies with an additional tool to bring their portfolios into compliance with the mandatory purchase requirements of the Flood Disaster Protection Act of 1973. The goal of the MPPP is to encourage owners to buy a standard insurance policy through the NFIP. To conduct the audit, the OIG spoke with parties involved with flood insurance including officials from Write Your Own (WYO) insurance companies, lending institutions, federal mortgage regulators, and FEMA. Based on the information collected, the OIG concludes that the MPPP is a potentially valuable tool to bring mortgage portfolios into compliance with the Flood Disaster Protection Act of 1973. Nonetheless, questions remain regarding the legality of requiring flood insurance on structures remapped into a SFHA and the accuracy of flood zone determinations. To achieve the desired end, the OIG recommends FIA do the following: advocate a change in
proposed legislation under consideration by the Congress to require the purchase of flood insurance whenever a structure, secured by a mortgage, is in a SFHA; proceed to develop and publish standards for flood zone determinations; and develop additional measures effectiveness of the MPPP, including the number of standard policies that are force placed into the NFIP as a result of MPPP notification letters.

Keywords: agency operations and management, insurance claims, Write Your Own Program
Abstract: The primary goal of FIA’s reinspection program is to ensure that claims are properly paid. This report finds that the program is not accomplishing its goal. Specifically, procedures to reinspect claims written by Write Your Own (WYO) companies are much more lenient than those used for direct claims, and the number of WYO claims reinspected is much smaller than that for direct claims. Moreover, FIA does not have an effective internal control system to track or monitor the results of reinspections. The report therefore recommends that FIA use uniform reinspection procedures for a test period to demonstrate the effect of using different procedures, increase the number of WYO claims inspected, and have WYO companies notify FIA within a few days of a claim filing to allow FIA to reinspect the claim before payment. Furthermore, the report recommends that FIA develop policies and procedures to track recommended claim adjustments and any subsequent repayments.

Keywords: Hurricane Iniki, Hawaii, building codes mitigation
Abstract: This report presents FEMA’s Building Performance Assessment Team’s (BPAT) observations on the success and failure of buildings in Hawaii to withstand the wind and flood forces generated by Hurricane Iniki in 1992. Property damage from the storm approached $1.8 billion. The BPAT found that buildings designed and constructed to accepted standards fared well: the majority of damage was due to incomplete or improper design and construction, including reliance on outdated methods and misapplication of building materials. These failures could be addressed with proper training. Lack of elevation was the primary determinant of flood damage in the observed area. Other factors included improperly embedded or constructed foundations, loose debris, and distance from shoreline. Buildings with elevated lowest floors performed better with respect to flood damage compared to buildings constructed directly on the ground surface. The report recommends that special consideration be given to the depth of structure foundations to account for erosion and that buildings be elevated above predicted flood heights in areas subject to flooding. Some of the recommendations would require changes in the administrative practices of the county government, while others are targeted at the construction industry.

Keywords:
Hurricane Andrew, Florida, building codes, mitigation

**Abstract:** This report presents FEMA’s Building Performance Assessment Team’s (BPAT) observations on the success and failure of buildings in Florida to withstand the wind and flood forces generated by Hurricane Andrew in 1992. Flood damage accounted for a limited portion of Hurricane Andrew’s total damages, relative to its size and strength. Hydrostatic pressure and inundation by storm surge accounted for the majority of damages. The report recommends that Dade County focus on improving the quality of construction workmanship by providing training to persons in the construction industry, developing a certification program for inspectors and supervisors, and involving licensed design professionals in the inspection of construction. With respect to the county, the BPAT recommends that the substantial damage provisions be enforced, that citizen participation in the building code process be increased, and that retrofitting needs be identifying and promoted.

**Keywords:**
agency operations and management, mitigation

**Abstract:** This report covers the audit of FEMA’s and selected states’ mitigation activities. It addresses initiatives to make mitigation a priority, obstacles to overcome, and suggestions for improving mitigation activities. The audit concludes that an effective mitigation strategy depends on state and local governments being willing and able to plan and fund such activities. All administrations and directorates within FEMA need to cooperate as do other federal agencies with responsibilities for mitigation. More streamlining of postdisaster grants can be achieved. Recovery programs need to emphasize mitigation. FEMA should develop measures of effectiveness for and encourage innovative approaches to mitigation programs.

**Keywords:**
building codes, coastal areas, erosion, floodproofing, mitigation, nonstructural approaches, Upton-Jones Amendment

**Abstract:** This report documents the broad range of nonstructural mitigation activities undertaken by communities exposed to coastal flooding and erosion and provides necessary documentation on which to base a federal, state, or local mitigation program. FEMA’s investigation revealed that many homeowners in coastal areas have floodproofed over the last several decades and, based on current construction activity, this trend continues. The elevation of homes in place and the relocation of homes to safer locations represent the primary means of floodproofing. FEMA found that in areas subject to significant wave action, elevation that keeps the lower area open and free of obstruction is the only in-place measure that can prevent structural damage. In areas subject to significant storm-induced scour (vertical erosion), residences whose foundations are not embedded well below the potential scour zone incur significant damage or total loss as a result of foundation failure. In areas subject to significant shoreline retreat over the long term (horizontal erosion), relocation and demolition are the only viable measures to floodproof unless actions are taken to forestall the erosion. Significantly,
FEMA’s investigation confirmed that floodproofing can avert flood insurance claims and disaster assistance payments, thereby reducing federal expenditures.

**Keywords:**
disaster assistance, enforcement, public assistance, mandatory purchase

**Abstract:** FEMA’s OIG audited the enforcement of the mandatory purchase requirements for recipients of grants from the Individual and Family Grant (IFG) Program and the Public Assistance (PA) Program. The audit of two FEMA regions revealed a low compliance rate. According to the OIG, FEMA does not effectively identify and monitor those grant recipients required to purchase and maintain flood insurance because the agency does not have clear, consistent policies and procedures on how to identify and enforce the requirements. IFG and PA workers need better training and assistance from FEMA to help them enforce the purchase requirements, a responsibility primarily handled by the states. Furthermore, enforcement problems arise because the IFG and PA programs do not highly prioritize mandatory purchase. In addition to activities currently undertaken by FEMA to increase compliance, the audit offers the following recommendations, among several others: develop guidance to enforce the flood insurance requirement for both the IFG and PA programs, ensure adequate training for state IFG and PA staff to understand and implement enforcement procedures, and continue plans to implement group flood insurance.

**Keywords:**
agency operations and management, insurance premiums, mapping

**Abstract:** This audit found that at least 27 percent of the policies in the sample had zone misratings and that 10 percent had incorrect premiums. Accordingly, the report concludes that FIA needs to improve its internal controls by expanding its review programs to include verification of rating factors. An obstacle to this is the complexity of the rating process, particularly the policy of administrative grandfathering. The report recommends assessing the impact of eliminating administrative grandfathering, and, if feasible, to begin phasing it out. It further recommends the establishment of a quality control program to monitor the accuracy of premium ratings and to identify problem areas. This will require improving the accuracy and content of FIA’s database on flood insurance policies. Lastly, the report recommends that the Mitigation Directorate establish a committee that includes map users to review mapping procedures and determine cost-effective ways to increase the detail on FIRMs to make them easier to use.

**Keywords:**
agency operations and management, disaster assistance, public assistance
Abstract: This report presents the results of the OIG’s audit of FEMA’s Disaster Relief Fund. The audit concentrated on the fund’s financial management and on issues that offer an opportunity for improving operations and reducing costs. Six chapters of the report examine reliability of financial data, appropriateness of expenditures, management of grants, management of disaster loan programs, economy and efficiency of operations, and effect of increased cost sharing. The audit revealed several flaws in FEMA’s management of the fund. For example, budget requests are flawed because they are based on unreliable financial data and on imprecise projections of disaster costs. The OIG recommends correcting this situation by developing a quality assurance program, including supervisory review, to ensure the support, accuracy, and reliability of data entered into and reported by the new Integrated Financial Management Information System. According to the audit, FEMA has awarded Public Assistance grants totaling billions of dollars to thousands of grantees without an adequate system to ensure the proper use of funds. Assigning certain administrative functions to agency’s Office of Financial Management would improve the management of grants. The Response and Recovery (R and R) Directorate would continue to have operational responsibility.

Keywords: communication, Community Rating System, marketing, media

Abstract: Through CRS outreach projects, communities earn credit for advising people of the flood hazard, the availability of flood insurance, and/or flood protection methods. Research has proven that awareness of the hazard is not enough; people need to be told what they can do about it. Credit for outreach projects is based on both the type of project and the topics covered. This report presents a literature review conducted by Human Technology, Inc. (HT) for FEMA. Based on HT’s research, effective public outreach materials must: be developed using simple, easily understood language; disclose factual information; be credible; be designed specifically for the targeted audience; involve the target audience; be positive; show that the audience has control over changing their behavior; and be presented in a meaningful way.

Keywords: Community Assistance Program, disaster assistance, federal programs, Flood Mitigation Assistance Program, Hazard Mitigation Grant Program, NFIP, Small Business Administration

Abstract: In a major or catastrophic disaster, the Federal Response Plan (FRP) will likely be activated. The FRP describes resources federal agencies can mobilize to support emergency and life-saving functions if the response capabilities of state and local government are overwhelmed. It outlines planning assumptions, policies, operational concepts, and organizational structures. This interagency publication summarizes federal programs that provide recovery assistance. The information is intended to serve as a starting point for disaster workers and local, state, and federal officials to locate sources of help as they seek more definitive information, such as eligibility criteria and application processes. Included are programs that make financial assistance available, as well as those that provide technical assistance and/or goods and other services. Program summaries are organized in two sections: 1) specific agency programs that exist for the express purpose of aiding disaster victims (disaster-specific programs) and 2)
regular agency programs that may be applied to disaster recovery under special circumstances (disaster-applicable programs).

**Keywords:** legislation, substantial damage

**Abstract:** This document covers the interpretation of FEMA’s regulations that govern the cost of replacement for damaged facilities. The regulation states that a facility is considered repairable when disaster damages do not exceed 50 percent of the cost of replacing a facility to its pre-disaster condition, and it is feasible to repair the facility so that it can perform the function for which it was being used as well as it did immediately prior to the disaster. According to FEMA, determining the eligibility of a facility for replacement will be calculated using the following formula: the cost of repair of the disaster damage (repair of the damaged components only, using present day materials and methods) divided by the cost of replacement of the facility with a facility of equivalent capacity, using current codes for new construction. If this calculation is greater than 50 percent, then replacement is considered to give a better return on the taxpayers’ investment and is thus eligible for funding.

**Keywords:** coastal areas, mapping, modeling, zoning

**Abstract:** Coastal communities generally have unique flood hazards because of storm surges and wave action from large open water bodies. Defining Coastal High Hazard Areas (V Zones) requires determination of wave elevations associated with the 1 percent annual chance flood. FEMA compiled these guidelines to specify technical policies and procedures to be employed in the preparation of coastal Flood Insurance Studies (FISs) and restudies. The guidelines provide unified instructions on the application of the methodologies used to determine the coastal flooding elevation hazards set forth in the FIS, and on the delineation of the flood elevations and hazards on the FIRM. The guidelines are not applicable to studies of the Great Lakes because those coastal areas require different analytical procedures and computer models.

**Keywords:** Base Flood Elevation, mapping, riverine areas, Special Flood Hazard Areas, zoning

**Abstract:** This guide was developed for use by community officials, property owners, developers, surveyors, and engineers who may need to determine Base Flood Elevations (BFEs) in special flood hazard areas (SFHAs) designated as approximate A Zones on Flood Insurance Rate Maps (FIRMs). One of the primary goals of this document is to provide a means to determine BFEs at a minimal cost. This guide is primarily intended for use in riverine and lake areas where flow conditions are fairly uniform (i.e., are not subject to unique flood hazards). The
guide is not appropriate for use in V Zone (velocity) areas or coastal A Zone areas that are subject to flooding due to storm surge from hurricanes and other coastal storms.

**Keywords:** agency operations and management, public assistance

**Abstract:** This inspection discusses potential cost reductions through changes to eligibility criteria for public assistance grants. Options are presented in the four primary areas: building codes and standards, repair versus replacement, private nonprofit organizations, and alternate projects. These options include amending the Stafford Act to limit funding to the federal estimated cost of returning a facility to its predisaster condition regardless of code requirements, to eliminate public assistance grants for private nonprofit organizations, and to eliminate the opportunity to accept reduced funding to use public assistance grants for alternate projects. The report also concludes that revising FEMA’s regulations to raise the cost repair threshold, which triggers replacement of a public facility, could reduce costs. In addition, the inspection identifies cost saving opportunities achieved from shortening the appeals process, depreciating building contents when calculating replacement costs, and converting eligibility for publicly owned parks, recreational facilities, and income producing facilities from public assistance grants to federal loans.

**Keywords:** Community Rating System, compliance, elevation certificates, insurance coverage

**Abstract:** This study determines if certain types of buildings built in certain years have a high probability of being compliant, post-FIRM buildings, thereby making it feasible to implement an option to write a flood insurance policy without an elevation certificate (i.e., a “no cert” option). The project collected data from a random sample of over 1,400 buildings located in communities participating in CRS. GPS technology was used to obtain accurate information on the elevations of the lowest of floors on the buildings sampled. This information was then compared with the BFE currently in effect and in effect at the time of construction to determine rates of compliance. Construction built after the community joined CRS and buildings constructed on slabs, on open stilts, and on crawlspaces exhibited the best rates of compliance. The statistical analysis of compliance for buildings on slab showed a statistically significant difference between pre- and post-CRS construction. The other two building types did not show a significant difference. The possibility for “no cert” rating depends on whether FIA can devise underwriting procedures that prevent clearly noncompliant buildings from slipping into a rating class without receiving a standard rating (i.e., based on elevation) and whether adequate monitoring of community compliance exists to keep only the best performing communities in CRS.

**Keywords:** NFIP
Abstract: This report provides an annual update on the status of the NFIP, detailing activities on policies, claims, and floodplain management. As of fiscal year 1996, the NFIP included 3,546,050 policies in 18,550 communities. The NFIP has over $369 billion of flood insurance in force. One of the program initiatives developed in fiscal year 1996 was the Group Flood Insurance Policy (GFIP), a program for individuals who apply for disaster assistance following a Presidentially declared disaster. Recipients are required to purchase coverage as a condition of the grant. 1996 also marked the first year of the Cover America campaign, designed to increase awareness of flood insurance. In the first year of the campaign, Cover America reached close to 135 million people through advertising and public relations efforts.

Keywords: building codes, Florida, Hurricane Opal, mitigation

Abstract: This report presents the findings of the Building Performance Assessment Team (BPAT) regarding building successes and failures during Hurricane Opal in Florida in 1995. BPAT found that utilities, such as electrical meters, panels, boxes, and wiring were routinely placed below a building’s lowest habitable floor, rendering the equipment vulnerable to storm surge, wave, debris, and overwash. Furthermore, many new, single-family structures had been constructed above or adjacent to portions of older, pre-FIRM structures and probably resulted from efforts to expand and/or reconstruct older, smaller structures. Based on its findings and conclusions, BPAT makes several recommendations including but not limited to, the location of all utility components (including electric meters) on the landward side of the structure and the improvement of the quality of new construction through superior design, construction, permitting, plan review, and inspection.

Keywords: Community Rating System

Abstract: The CRS was implemented in 1990 with three goals: to reduce flood losses, to increase awareness of flood insurance, and to promote more accurate insurance rating. This biennial report is submitted pursuant to the National Flood Insurance Reform Act of 1994 and provides an analysis of the program’s cost-effectiveness, a description of the program’s accomplishments and shortcomings, and any recommendations for pertinent legislation. One section of the report discusses improvements made to the program in the area of customer service. For example, FEMA replaced the CRS Application with a Short Form Application to simplify the application process. FEMA also revised the 1995 version of the CRS Coordinator’s Manual to reflect additional goals established by the Reform Act of 1994. The final section of the report presents the various efforts undertaken by FEMA to evaluate the effectiveness of the program with extensive discussion on the survey of local officials in 1996. Overall, preliminary analysis indicates that CRS is working as intended and that the program is achieving its goals.

Keywords:
agency operations and management, flood damage, park and recreation facilities

Abstract: This report focuses on six areas that accounted for considerable disaster grants for park and recreational facilities between fiscal years 1989-95: debris removal, building damage, revenue-generating facilities, marinas, golf courses, and tree and shrub replacement. The report discusses options for reducing costs in these areas and the associated impacts their implementation would incur. The options discussed include: (a) limiting funding for park and recreational facilities to debris removal only; (b) limiting funding to the repair/replacement of recreational buildings only; (c) excluding revenue-generating facilities from receiving any grant funding; (d) eliminating funding for marinas and golf courses with the exception of debris removal; and (e) eliminating funding for trees, shrubs, and other planting replacement for all recreational facilities other than parks. The report makes no recommendations.

Keywords:
communication, Community Rating System, marketing, media

Abstract: Residents from five CRS and five non-CRS communities were contacted to assess whether CRS credited outreach activities are educating residents about the flood hazard and motivating them to take action to protect themselves and their property. The survey matched the five CRS communities and five non-CRS communities based on similar demographics, flood history, and flooding hazards. A minimum of 50 floodplain residents from each of the 10 communities was interviewed. This report presents findings from the 500 interviews. Overall, the findings indicate that residents are aware of flood hazards and are taking actions to protect their property from flood damage. Furthermore, results show that residents in CRS communities are more educated about these hazards and are therefore taking more proactive measures. Residents from CRS communities are more aware than residents from non-CRS communities that their home is located in a SFHA. Still, a large percentage of CRS residents indicated that they did not know whether their homes were in a SFHA.

Keywords:
building codes, Hurricane Fran, mitigation, North Carolina

Abstract: This report presents the observations of FEMA’s Building Performance Assessment Team (BPAT) regarding the success and failures of buildings that experienced wind and flood effects of Hurricane Fran in North Carolina in 1996. During its evaluation BPAT found that on old and new oceanfront homes many porches, decks, and roof overhangs supported on vertical foundation members collapsed or became structurally unsound. The vast majority of vertical foundation members were found to have been embedded only 4 to 5 feet below existing grade without any regard for erosion or scour. Furthermore, the concrete slabs observed did not have a sufficient number of contraction joints to promote the slab’s breaking into small pieces. Based on its findings and conclusions, BPAT makes several recommendations including, but not limited to, the embedment of pilings for structures in areas subject to erosion and the presence of a sufficient number of contraction joints between pilings and in both directions on the surface of a concrete slab.

**Keywords:**
NFIP, ICC coverage

**Abstract:** This report provides an annual update on the status of the NFIP, detailing activities on policies, claims, and marketing. As of fiscal year 1997, the NFIP included 3,811,253 policies—an increase of 7.5 percent from the previous year—protecting $422.4 billion in flood insurance. Premiums for NFIP policies in force grew by 15 percent in fiscal year 1997. Several severe flooding events resulted in total claims payments of over $630 million. Between 1995 and 1997 the NFIP made claims payments of more than $2.8 billion. FEMA initiated several new programs in 1997. First, Increased Cost of Compliance (ICC) coverage offers funding to homeowners to help cover the costs of bringing homes and businesses into compliance with community floodplain ordinances. To explain the new coverage, the NFIP offered 12 training workshops nationally, attended by more than 800 people, and published several brochures describing coverage availability. FEMA’s Project Impact, an initiative designed to foster pre-disaster mitigation for all hazards, is also described.

**Keywords:**
coastal areas, Coastal Barrier Resources System, coastal barriers, Delaware, development, insurance coverage, insurance purchase decision, risk perception

**Abstract:** Over the last two decades, a question has arisen as to what role, if any, the availability of flood insurance has played in a local community’s decision to develop or not develop coastal, beachfront areas. One opinion is that the availability of flood insurance in these areas is either the deciding factor or at least a major factor that influences that decision. Another opinion is that the decision to develop or not develop is the result of the economic forces affecting the area in question at the time of the decision. This report uses the community of North Bethany Beach, DE, in an attempt to study this question. Interviews with local government officials, developers, realtors, insurers, and mortgage lenders show that the most important factors in promoting development at North Bethany Beach are proximity to major metropolitan areas, the supply and demand of oceanfront property, lifestyle, exclusivity, and the overall national economy. For high-end coastal property, such as North Bethany Beach, it appears that federal flood insurance plays a secondary or even tertiary role in coastal development. This report notes the importance of conducting similar studies in other coastal areas where real estate is considerably less expensive.

**Keywords:**
federal programs, flood disaster planning, Flood Mitigation Assistance Program, mitigation

**Abstract:** Under the Flood Mitigation Assistance (FMA) Program, FEMA provides assistance to states and communities for activities that will reduce the risk of flood damages to structures insurable under the NFIP. FMA is a state-administered, cost-share program through which states and communities can receive grants for planning, technical assistance, and projects related to flood mitigation. The three goals of the program are 1) to reduce the number of repetitively or
substantially damaged structures and the associated claims on the National Flood Insurance Fund; to encourage long-term, comprehensive mitigation planning; 2) to respond to the needs of communities participating in the NFIP by expanding their mitigation activities beyond the review of floodplain development and permitting; 3) and to complement other federal and state mitigation programs with similar, long-term goals. The chapters in this guidance provide an overview of FMA; the federal, state, and local roles in administering the program; planning grants; project grants; technical assistance grants, requirements for cost-sharing and limitations on funding; and management of grants.

Keywords: building codes, mitigation, substantial damage

Abstract: Communities that participate in the NFIP often have difficulty determining whether structures meet the program’s definition of being substantially damaged. This is particularly true after a major flood or other disaster in which large numbers of buildings have suffered damage and there is a need to provide damage determinations so that reconstruction can begin. Substantially damaged structures in SFHAs must be brought into compliance with the minimum requirements of a community’s floodplain management ordinance and the NFIP. To assist communities in making determinations of substantial damage, FEMA developed the Residential Substantial Damage Estimator (RSDE) software, which provides guidance in estimating building value and damage costs for both single family and manufactured homes. Based on the NFIP’s regulatory requirements, the software is intended to be used in conjunction with industry-accepted, residential-cost estimating guides. This document provides information on how to use the software as well as how to collect data and conduct field inspections. FEMA updated the guidance in August 2001.

Keywords: agency operations and management, mapping, strategic planning

Abstract: This report represents the initial product of a task force convened to plan the future of FEMA’s Flood Hazard Mapping Program. It surveys the current state of the program, presents a visionary plan for the future, and details the strategies for implementing the plan. The cornerstones of the modernization plan are: (a) to develop accurate and complete flood hazard information for the entire nation; (b) to provide that information in a readily available, easy-to-use format; and (c) to alert and educate the public regarding the risks of flood hazards. The plan will use existing digital engineering, mapping, information management, and electronic communication technologies to improve the program in four primary areas: map accuracy and completeness; map utility; map production; and public awareness and customer service. A cost-benefit analysis is currently being conducted to determine if the benefits to the nation resulting from the plan will exceed the costs.

Keywords: hazard identification, risk assessment
Abstract: This document summarizes the findings of a research project to clarify and document previous efforts to identify natural and technological hazards and to assess associated risks. The report is one part of an effort to develop a national approach to mitigating human and economic losses caused by disasters. The chapter on floods includes sections on hazard identification; risk assessment; research, data collection, and monitoring activities; and mitigation approaches. Among others, the report concludes that the large influx of people to coastal areas over the past 30 years resulted in thousands of residents who are unaware of the hazard associated with hurricanes and floods in coastal high-hazard zones. Also, the report claims that in the immediate shorefront area affected by tropical cyclones, relocation of exposed utility lines, water mains, sewer lines, and roadways has been effective in mitigating damage. The report warns that land-use controls and regulatory setback programs in coastal high hazard zones can be difficult because of intense development pressure and high property values. The report states that the NFIP has probably been the most dominant positive influence on floodplain management over the past 15 years. However, the majority of buildings exposed to identified flood hazards remains uninsured.

Keywords: buyouts, floodproofing, insurance, insurance coverage, mitigation, relocation, substantial damage

Abstract: This guidance document provides information on the Increased Cost of Compliance (ICC) coverage under the NFIP and how it relates to local administration of floodplain management laws or ordinances following a flood event. Specifically, the guidance discusses how insured buildings under the NFIP that are damaged by flooding will benefit from this coverage, how ICC coverage relates to local administration of floodplain management laws or ordinances, what types of mitigation measures are allowed under ICC, and what types of technical assistance are available for state and local officials. ICC coverage provides for the payment of a claim to help pay for the cost to comply with state or community floodplain management laws or ordinances after a flood event in which a building has been declared substantially or repetitively damaged. When a flood damages an insured building and the state or community declares the building to be substantially or repetitively damaged, ICC will help pay for the cost to elevated, floodproof, demolish, or relocate the building up to a maximum benefit of $15,000 ($30,000 as of May 1, 2003). This coverage is in addition to the building coverage for the repair of actual physical damages from the flood under the Standard Flood Insurance Policy (SFIP).

Available at: http://www.fema.gov/library/splan.pdf

Keywords: agency operations and management, strategic planning

Abstract: This update of FEMA’s 1994 strategic plan complies with the requirements of the Government Performance and Results Act. The plan describes FEMA’s role as leader for the Nation’s emergency management system and its specific responsibilities, mission, vision, eight core values, and strategic planning template. The plan then identifies the agency’s three strategic
goals: (a) protect lives and prevent the loss of property from all hazards; (b) reduce human suffering and enhance the recovery of communities after disaster strikes; and (c) ensure that the public is served in a timely and efficient manner. For each goal, strategic objectives are identified, including performance measures, strategies to achieve each goal, five-year operational objectives, the legal authorities to support the strategy, the technology to implement the strategy, and the methods to evaluate performance.

**Keywords:**
age agency operations and management, strategic planning

**Abstract:** This plan outlines how FEMA’s strategic goals and objectives will be pursued during Fiscal Year 1999. The annual performance goals presented in the plan support a five-year operational objective contributing to one of three strategic goals: to protect lives and prevent the loss of property from natural and technological hazards, to reduce human suffering and enhance the recovery of communities after disaster strikes, and to ensure the public is served in a timely and efficient manner. Some of the objectives within these goals include a reduction in expected annual flood disaster losses by $1 billion and the identification of the most critical 10-percent of weaknesses in state capability while maintaining the current capability of states and localities to respond to disasters. Other objectives seek to achieve training and education opportunities for the fire protection community and to use information technology upgrades to improve services and accessibility that reduce the costs for the response to and recovery from emergencies and disasters.

**Keywords:**
Community Rating System, mitigation

**Abstract:** In 1994, a formal evaluation of the overall effectiveness of the Community Rating System (CRS) was initiated. Due to the technical and statistical nature of these evaluation analyses and the need for impartial expertise, FEMA retained Human Technology, Inc. to assist in this endeavor. The data collection and analytical techniques included questionnaires and surveys, technical studies, site visits, focus groups, and reviews by experts. As a result of the evaluation efforts, three general conclusions were reached with regard to changes in the CRS creditable activities: (a) certain elements deserve more credit based on a review of their effectiveness in reducing flood losses; (b) communities should be encouraged to design their own programs; and (c) scoring procedures and documentation requirements should be simplified. Overall, CRS has become an important tool for mitigation as well as a mechanism for integrating mitigation with insurance.

**Keywords:**
Community Rating System

**Abstract:** Four years after the implementation of the Community Rating System (CRS) in 1990, FEMA’s Community Rating System Task Force formed an Evaluation Committee to determine whether CRS is meeting its original expectations. If it is not, adjustments to the program, including training and nontraining interventions, may be necessary to ensure that the long-term
goals will be achieved. The Local Official Survey was designed to determine CRS local officials’ opinions about the effectiveness of the CRS program and the usefulness of specific flood protection activities for which FEMA awards credit. This report provides the data collected from the Local Official Survey and is divided into the following components: overall responses, demographics, and statistical analysis. A total of 897 CRS Coordinators were sent surveys. This number represents every community participating in the CRS program from 1990 to 1994. Of the 897 surveys, a total of 661 surveys were returned (return rate of 73.69 percent). Overall, findings from the survey indicate respondents hold positive opinions toward the program and its benefits; feel the program educates and protects the public; believe that the benefits of program may not outweigh the administrative costs, time, and effort required; and support a simple system for crediting program activities. Based on survey comments, two activities that warrant additional consideration by the Evaluation Committee are outreach and repetitive loss projects.

Keywords: NFIP
Abstract: This report provides an annual update on the status of the NFIP and includes discussion of program growth, claims and flooding statistics, changes to the program, studies undertaken by FEMA, marketing and training, and future initiatives. At the close of fiscal year 1998, the NFIP had more than 4.1 million flood insurance policies in effect. In 1998, the NFIP paid claims losses of over $670 million. The report also discussed the implementation of Project Impact, a multihazard mitigation program. Nearly 120 communities and 800 companies were involved with Project Impact, initiated in 1997.

Keywords: Hazard Mitigation Grant Program, mitigation, Stafford Act
Abstract: This document is intended to guide personnel responsible for the administration of FEMA’s public assistance grant program. Its aim is to help ensure national consistency in the use of Section 406 mitigation funds, promote measures that reduce future loss to life and property, protect the federal investment in public infrastructure, and, ultimately, to help build disaster-resistant communities. An appendix lists potential mitigation measures that can be considered cost effective. FEMA considers a mitigation measure to be cost-effective when the measure: (a) does not exceed 100 percent of the project’s cost; (b) is appropriate to the disaster damage; (c) will prevent future similar damage; (d) is directly related to the eligible damaged elements; (e) does not increase risks or cause adverse effects to the property or elsewhere; (f) meets standards of good professional judgment; and (g) otherwise meets requirements stipulated in the policy on hazard mitigation funding under Section 406 of the Stafford Act.

Keywords: compliance, enforcement, insurance coverage, mitigation, pre-FIRM structures, property values, repetitive losses
**Abstract:** This paper characterizes the NFIP’s repetitive loss problem and discusses what FEMA has done to address the issue. A repetitive loss building is defined in this paper as one that has had at least two losses over $1,000 in any 10-year period since 1978. As of March 31, 1997, there were cumulatively 208,174 losses totaling $2.8 billion paid on 76,284 repetitive loss properties. Repetitive losses account for 32.4 percent of the number of losses incurred since 1978 and 37.8 percent of all dollars paid. The $2.8 billion in losses includes $2 billion in building losses and $800 million in contents losses. In addition to detailed statistics and extensive discussion on repetitive loss properties, the paper also reviews initiatives undertaken by FEMA to address the problem. For example, FEMA has developed a series of manuals and courses aimed at providing information to design professionals and homeowners on retrofitting. The establishment of the Flood Mitigation Assistance (FMA) Program in 1994 secured funds to reduce losses to repetitive loss and substantially damaged properties. Finally, FEMA requires communities participating in the Community Rating System (CRS) and having 10 or more repetitive loss buildings to develop a repetitive loss plan as a condition of participation.

**Keywords:**
agency operations and management, mapping, strategic planning

**Abstract:** This document compiles the reports from groups working to modernize FEMA’s Flood Hazard Mapping Program. The findings of the work groups became a report presented in 1997 to FEMA’s director. The report surveys the current challenges facing the NFIP’s mapping program and presents a plan for an efficient transition to the electronic age. The document also includes a cost analysis and time frames for enacting the plan at various levels of funding. The Hazard Identification and Risk Assessment Division recommended the plan as the best means of addressing current challenges and enhancing the role of flood hazard maps as a valuable national resource for flood hazard mitigation and relief. A version of this report—*Modernizing FEMA’s Flood Hazard Mapping Program, A Progress Report*—was issued to constituents of the flood mapping program in November 1997. As a result of this plan, state and local officials, private property owners, and others will be made more aware of flood hazards nationwide. This awareness, it is hoped, will be realized through an increase in the sale of flood insurance policies and through the construction of safer communities. Thus, the plan will reduce the burden on the general taxpayer for disaster relief and maintain the maps as a valuable resource for mitigating flood hazards. The cornerstones of the plan are to use state-of-the-art technology to develop accurate and complete flood hazard information for the entire nation; to provide that information in a readily available, straightforward format; and to alert and educate that public regarding the risks of flood hazards.

**Keywords:**
mandatory purchase, public assistance

**Abstract:** This review determines whether FEMA could improve its administration of the insurance coverage mandate in the Public Assistance Program. The review identified the following opportunities to streamline the application, review, and approval process for such assistance: (a) recruit a cadre of insurance specialists; (b) require all pertinent insurance
information at the time of application for assistance; and (c) consider anticipated insurance proceeds in determining eligibility for funding at the beginning of the process. The review also recommends that FEMA clarify its rules governing waivers of requirements for insurance granted by state insurance commissioners.

Keywords: insurance coverage, insurance premiums, mitigation, substantial damage, substantial improvement

Abstract: This audit examines how well the substantial damage rule is working as a mitigation tool and how it can be strengthened to work more effectively in the future. The OIG concludes that the substantial damage rule could prove a more effective mitigation tool if communities in the NFIP did a better job of identifying potentially substantially damaged structures. For example, communities declared only 106 structures as substantially damaged from a sample of 603 structures identified as substantially damaged using insurance claims data. As a result, mitigation efforts did not occur, which contributes to the problem of repetitive losses. Thirty-two percent of the structures included in the OIG’s sample had repetitive losses totaling $19 million. Furthermore, a test of 43 structures declared substantially damaged by communities revealed that only 11 received a reclassification of post-FIRM and an actuarial re-rating. Based on its findings, the OIG recommends FEMA should 1) implement processes to ensure communities, FEMA officials, and policyholders promptly receive insurance claims information that will assist them in identifying potentially substantially damaged structures; 2) require communities to use the most objective sources to estimate costs when calculating substantial damage; and 3) consistently manage and monitor community enforcement of the substantial damage rule.

Keywords: Alabama, building codes, Florida, Hurricane Georges, Mississippi, mitigation

Abstract: This report presents FEMA’s Building Performance Assessment Team’s (BPAT) observations on the success and failure of buildings in the Florida Keys and Gulf Coast to withstand the wind and flood forces generated by Hurricane Georges in 1998. During its evaluation BPAT found that engineered structures constructed in accordance with current building codes, such as the Standard Building Code (SBC), requirements adopted at the local level to participate in the NFIP, and additional state and local standards performed well. Furthermore, publicly financed flood mitigation programs and planning activities clearly had a positive impact on the communities where they were implemented. Based on its findings and conclusions, BPAT makes several recommendations including, but not limited to, the adoption of a freeboard requirement (i.e., elevating a structure above BFE) by local communities and the continued development and maintenance of hazard mitigation plans at the state and local levels.

Keywords: Hurricane Georges, Puerto Rico, building codes, mitigation

Abstract: This report presents FEMA’s Building Performance Assessment Team’s (BPAT) observations on the success and failure of buildings in Puerto Rico to withstand the wind and flood forces generated by Hurricane Georges in 1998. The BPAT focused its investigation on the performance of single-family residential home construction and examined isolated examples of the damage to commercial and mid- and high-rise buildings. The BPAT found that a significant amount of the damage caused by Hurricane Georges could have been avoided if more buildings had been constructed in accordance with Puerto Rico’s existing building code. The majority of damages were observed in self-built homes, which are often constructed without a building permit or design services. The prevalence of this construction type potentially lessens the impact of revisions to the building code and permitting process. However, a lack of compliance with and enforcement of state floodplain management and too little attention to mitigation by the state contributed to the damages. Following the hurricane, Puerto Rico undertook several steps to reduce the risk of future flood damages including the adoption of a new building code and a strategic plan to provide training to officials. The results of the BPAT report provide an important tool for Puerto Rico to evaluate the vulnerability of residences, utilities, and commercial properties to disaster-related damages and target public education, mitigation, and regulatory revisions accordingly.

Keywords: agency operations and management, floodplain management, mapping, strategic planning

Abstract: FEMA has an ongoing program to update flood maps for flood-prone communities because flood conditions change over time due to natural and man-made changes in watersheds and floodplains. At the same time, however, the need for updated flood maps is increasing and federal funding is limited. As a result, a significant portion of the 100,000-panel flood map inventory is outdated. In 1997 FEMA designed a plan to modernize the inventory. Over time, the objective is to eliminate the existing backlog of outdated maps and to convert all the maps to a digital format. One of the key objectives of the modernization plan is to increase local involvement in, and ownership of, the mapping process. Therefore, the Cooperating Technical Community (CTC) concept was developed. As technologies have increased dramatically, many states, regional agencies, and local communities have become increasingly sophisticated and have invested significant resources in the identification of flood hazards. This document contains the initial guidance for the CTC initiative. Some of the objectives of the CTC initiative are: (a) to recognize the timely and accurate flood hazard information provided by CTC partners to FEMA, (b) to integrate contributing partners into the mapping process, and (c) to provide training and technical assistance. To implement these objectives, CTC partners need to enter into an overall partnership agreement with the appropriate FEMA Regional Mitigation Division. As the CTC partner and FEMA identify specific tasks to undertake, agreements will be developed and entered into under the umbrella of the overall CTC Partnership Agreement.

Keywords:
Cover America, marketing, NFIP, risk communication, Write Your Own Program

Abstract: In October 1995, FIA started a national marketing and advertising campaign called Cover America. The campaign’s goals include improving awareness of and attitudes toward the NFIP and flood insurance, stimulating demand for flood insurance, and providing opportunities for insurance agents, Write Your Own (WYO) companies, and other NFIP stakeholders to participate in and build on the messages delivered. The Cover America campaign uses paid advertising and public relations to reach consumers, insurance agents, and other NFIP stakeholders. Market research is conducted throughout the year to assess how well the campaign is meeting its goals. Findings from this research and other tracking mechanisms are used to improve the campaign. This document describes the campaign and its different components: television, print and radio advertising, direct mail, and Yellow Pages. This document also describes the NFIP cooperative advertising program, which provides WYO companies and insurance agents the opportunity to split their advertising costs for any approved flood insurance print or Yellow Pages display ads with the NFIP as well as the development of public relations and of collateral materials such as brochures. This document also provides some results attributable to the Cover America campaign. Those results are in concordance to those produced for FEMA by Gallup and Robinson, Inc. (1999).

Keywords:
environmental policy, federal programs, public assistance

Abstract: This document compiles all environmental policy memoranda that have been issued by FEMA and in effect as of May 1999. The document should serve as an easy reference for program staff coordinating public assistance grant activities involving environmental issues. Five environmental memoranda are included: (a) Categorical Exclusion (CATEX) of Projects Involving the Acquisition of Damaged Properties and Implementation of E.O. 12898 Concerning Environmental Justice, April 18, 1994; (b) Other Federal Agency Clearance for Environmental Assessments, May 24, 1994; (c) Policy for Projects Completed Without Environmental Review Required by the National Environmental Policy Act (NEPA), March 24, 1995; (d) Availability and Use of the Updated List of Categorical Exclusions Published February 5, 1996, as a Revision of 44 CFR 10.8, February 27, 1996; and (e) Documentation of the National Environmental Policy Act (NEPA) Categorical Exclusions (CATEX), June 20, 1997.

Keywords:
NFIP, map modernization

Abstract: This report provides an annual update on the status of the NFIP. It details activities on policies, claims, marketing, communication, and training. As of fiscal year 1999, the NFIP had 4,187,729 policies in 19,023 communities. Hurricanes Frances, Georges, and Floyd represented some of the major flood disasters of the year. Payments on insurance claims from Hurricane Floyd alone totaled nearly $398 million. Several important initiatives occurred in 1999. The number of communities participating in Project Impact reached 185, with more than 1,000 business partners. Legislation was introduced in Congress to reduce the burden of repetitive flood losses. FEMA developed a Map Modernization Plan to update and digitize flood insurance
rate maps. In order to finance the cost of mapping, FEMA developed the Cooperating Technical Community (CTC) Program, in which FEMA establishes formal agreements with communities, regional agencies, and states to conduct mapping in a particular area.

**Keywords:** flood insurance studies, floodplain management, mapping, Special Flood Hazard Areas

**Abstract:** These guidelines define the technical requirements, coordination and documentation activities, and product specifications for a variety of technical tasks such as reviewing the results of studies completed by FEMA’s study contractors; converting nonflood-prone and minimally flood-prone communities to the regular phase of the NFIP; processing requests for revisions to flood insurance studies and FIRMs; identifying letters of map change that are superseded when a revised FIRM becomes effective; processing community requests for map updates to reflect recent annexations; processing requests for FEMA’s review of determinations made by lending institutions whether buildings or manufactured homes are located in identified SFHAs; responding to inquiries from FEMA’s constituents about the NFIP; responding in writing to inquiries from Congress about mapping-related matters; processing map revisions under the Coastal Barrier legislation; performing riverine and coastal erosion studies; providing risk assessment activities; and others.

**Keywords:** Alabama, buyouts, cost-benefit analysis, Hazard Mitigation Grant Program, mitigation

**Abstract:** This report tells the story of how the cities of Elba and Geneva, AL, with help from FEMA, reduced the impact of repeated flooding. The report begins with a discussion of the Hazard Mitigation Grant Program (HMGP) and provides an overview of the benefit-cost analysis used by FEMA to evaluate mitigation projects. An explanation of the hazard mitigation projects implemented in each community follows. FEMA funded the installation of a stormwater drainage system in Elba and the removal of flood-prone properties in Geneva. Both communities realized the benefits of mitigation when flooding occurred only a few years after the projects’ implementation. Results from the projects underscore the success of mitigation in hazard-prone communities.

**Keywords:** buyouts, cost-benefit analysis, Georgia, Hazard Mitigation Grant Program, mitigation

**Abstract:** This report tells the story of how the cities of Newton and Albany, GA, with help from FEMA, reduced the impact of repeated flooding. The report begins with a discussion of the Hazard Mitigation Grant Program (HMGP) and provides an overview of the benefit-cost analysis used by FEMA to evaluate mitigation projects. An explanation of the hazard mitigation project implemented in each community follows. FEMA funded the removal of hundreds of flood-prone properties in both Newton and Albany. Both communities realized the benefits of mitigation
when flooding occurred only a few years after the removal of the properties. Results from the project underscore the success of mitigation in hazard-prone communities.

**Keywords:** Hazard Mitigation Grant Program, legislation, mitigation, Stafford Act  
**Abstract:** Authorized under Section 404 of the Stafford Act, FEMA’s Hazard Mitigation Grant Program (HMGP) provides grants to state and local governments to implement long-term hazard mitigation measures after a major disaster declaration. The program aims to reduce the loss of life and property due to natural disasters and to enable the implementation of mitigation measures during the immediate recovery from a disaster. FEMA can fund up to 75 percent of the eligible costs of each project. Eligible applicants include state and local governments, Native American tribes, and certain nonprofit organizations. Although homeowners and businesses cannot apply directly to the program, a community can apply on their behalf.

**Keywords:** Coastal Barrier Resources System, Community Rating System, compliance, disaster assistance, enforcement, floodplain management, insurance, mapping, mitigation, NFIP, substantial damage, substantial improvement, training, variances  
**Abstract:** All levels of government—local, state, and federal—and the private sector share responsibility for flood loss reduction. Fulfilling this responsibility depends on having the knowledge and skills to plan and implement needed floodplain management measures. The fundamental floodplain management program that others are built on is the NFIP. The purpose of this home study course is to enhance the knowledge and skills of local officials responsible for administering and enforcing local floodplain management regulations. It is also intended to broaden the understanding of floodplain management strategies that can be applied at the local level. The course is for the local official responsible for administering the community’s floodplain management program. Primary instructional material for the course includes 10 units on topics related to the NFIP and seven appendices.

**Keywords:** legislation, lending institutions, mandatory purchase  
**Abstract:** Title V of the Riegle Community Development and Regulatory Improvement Act of 1994 (the Reform Act) substantially amended the National Flood Insurance Act of 1968 and the Flood Disaster Protection Act of 1973. The Reform Act tightened the mandatory purchase provisions that originated with the Flood Disaster Protection Act of 1973. As the result of the Reforms Act’s continuing impact upon lenders, FIA updated and reformatted the guidelines for mandatory purchase, previously issued in October 1989 and May 1997. These guidelines present an overview of the Reform Act as it amended the 1973 Act. They explain the applicable statutes or regulations. Several appendices contain the relevant statutes and regulations addressed in the guidelines as well as specific supplementary information referenced in the document. The guidelines also include process flowcharts, a glossary, and an index.

**Keywords:**
mapping

**Abstract:** The Mapping Activity Statements cover a range of products and services that depend on the partner’s interest, technical expertise, and available resources. The statements can cover simple activities, such as providing a digital base map, and more sophisticated activities, such as conducting flood hazard studies and preparing print-ready digital flood maps for distribution by FEMA. Nine templates for Mapping Activity Statements are included. These templates address the most common mapping activities and can be used directly or as guidelines for the development of specific agreements between FEMA and its local, regional, or state partners. According to FEMA, agreements other than the nine listed may also be possible.

**Keywords:**
historic sites, legislation, public assistance

**Abstract:** This document makes available the Model Programmatic Agreement to accomplish the requirements of Section 106 under the National Historic Preservation Act (NHPA) of 1966, as amended. It is intended for FEMA personnel who coordinate historic review for the agency’s undertakings using public assistance grants. Section 106 of NHPA requires all federal agencies to review the effect of an agency undertaking on historic properties prior to funding the project, activity, or program. FEMA developed this document to simplify and expedite coordination and to provide specific guidance to consulting parties in the historic review process. This document also exempts routine disaster-recovery activities with little potential of adversely affecting historic properties from the review mandated by NHPA.

**Keywords:**
hydrology and hydraulics, mapping

**Abstract:** This document describes FEMA’s plan to modernize its mapping program through cooperative agreements with state and/or local partners. FEMA will provide funds for mapping, technical assistance, and mentoring to the state or local partner, which will then develop and maintain all or a component of its flood map, thus maintaining the connection between mapping and managing flood hazard areas. One conclusion is that FEMA’s maps should display floodplains based on future conditions hydrology, as determined by the local partners, while FEMA will continue to require regulation of floodplain development based on existing conditions data. Topics discussed include the role of state and local partners; emphasis on local mapping needs; historical perspective on future conditions; defining future conditions; use of flood hazard maps for floodplain management, flood insurance rating, and other purposes; constraints and benefits of using future conditions data on NFIP maps; conclusions; and implementation through map specifications, Cooperating Technical Community agreements, revisions, rule making, and outreach.

Keywords:
agency operations and management, mapping, strategic planning

Abstract: FEMA developed a plan in 1997 to modernize its program of mapping flood hazards. This report summarizes the progress made toward implementing the plan in Fiscal Year 1999. The plan is a seven-year effort to upgrade FEMA’s inventory of flood maps and enhance its products, services, and processes. It is anticipated that the map modernization plan will help prevent approximately $26 billion in flood damages to new buildings over a 50-year period. The major components of the process include an assessment of mapping needs, a tailored scope of work to be developed with FEMA’s mapping partners, and concurrent production processes. Based on accomplishments to date and current map modernization priorities, FEMA has updated the list of map modernization objectives. Some objectives identified on the original list are now fully developed, ongoing components of the flood mapping program and thus, have been removed from the list (e.g., FEMA Map Assistance Call Center). Others are no longer considered as map modernization objectives but rather, are continuing under normal operations of FEMA’s flood mapping programs. Finally, new objectives have been identified and initiated in the report.

Keywords:
public assistance, Stafford Act

Abstract: This document specifies criteria by which FEMA will recognize the eligibility of costs under the Public Assistance Program incurred through mutual aid agreements between applicants and other entities. It is intended for personnel involved in the administration of the Public Assistance Program and applies to emergency work authorized under Sections 403, 407, and 502 of the Stafford Act. The motivation for this document is as follows: many state and local governments and private nonprofit organizations formulate mutual aid agreements to provide emergency assistance to each other in the event of disasters or other crises. The conditions of the agreements may be to provide reciprocal services or to receive direct payment through specific labor and equipment rates outlined in the agreements. These agreements usually are written but, occasionally, are by understanding or are arranged after a disaster occurs. The document addresses both written and unwritten mutual aid agreements. Among others, the document lists the conditions under which FEMA will reimburse the cost of mutual aid agreement associated with emergency assistance. For example, FEMA will not reimburse applicants who do not advertise and award competitive bid contracts for permanent repairs. Moreover, FEMA recognizes only mutual aid agreements between governments or private, nonprofit organizations in separate areas and does not recognize mutual aid agreements between agencies, departments or entities of the same town, county, or state government.

Keywords:
lending institutions, mandatory purchase, NFIP, risk communication

Abstract: This book provides information about communities participating in the NFIP as well as communities not participating in the program but that have special flood hazards identified by FEMA. The purpose of the book is to assist federally regulated lenders in determining whether
flood insurance must be required as a condition of receiving a mortgage, to assist property owners and insurance agents in determining whether flood insurance is available in a particular community, and to determine the availability of a FIRM for a particular community. The book also contains several useful appendices on topics including mandatory purchase and regulations for lenders, the Mortgage Portfolio Protection Program (MPPP), guidelines and requirements for the Write Your Own (WYO) Program, and criteria for private flood insurance. FEMA updates the Community Status Book on a monthly basis.

**FEMA. (1999).** *Numerical Models Accepted by FEMA for NFIP Usage.* Washington, DC: FEMA.

**Keywords:** hydrology and hydraulics, mapping, modeling

**Abstract:** FEMA has developed a comprehensive listing of all numerical models acceptable for NFIP usage. This document is arranged under a chart format that provides essential references for coastal models (coastal storm surge, coastal wave height, and coastal wave effects models), hydrologic models (single event and continuous event models), statistical models, hydraulic models (one-dimensional steady flow, one-dimensional unsteady flow, two-dimensional steady/unsteady flow, and floodway analysis models), and sediment transport models.

**Keywords:** agency operations and management, strategic planning

**Abstract:** In Fiscal Year 1997, FEMA developed its strategic plan, *Partnership for the Future,* and the Fiscal Year 1999 Annual Performance Plan (APP) on which this report is based. These first planning efforts under the Government Performance and Results Act reflect FEMA’s commitment to produce comprehensive planning documents in support of effective and efficient government and are very ambitious. While each of the 66 APP activities leads toward the achievement of FEMA’s strategic goals, the agency believes that the detail and continuing measure of some of the activities is more meaningful at the program levels than it is at the strategic levels. For this reason, during Fiscal Year 1999, FEMA revised its strategic objectives to tighten the focus of its annual goals toward more measurable outcomes consistent with the agency’s mission. This report is divided into two sections. The first section highlights Fiscal Year 1999 activities, goals and measures that demonstrate the breadth of FEMA’s efforts and achievement toward its strategic goals. The second section is a comprehensive report of Fiscal Year 1999.

**Keywords:** public assistance

**Abstract:** FEMA’s Public Assistance (PA) Program provides grants to support the recovery of public infrastructure. Potential recipients of this funding include state and local governments and certain types of private, nonprofit organizations. This guide describes the program’s provisions and application procedures and replaces the guide issued in September 1996.

**Keywords:** erosion, mapping, modeling, riverine areas

**Abstract:** Section 577 of the National Flood Insurance Reform Act of 1994 requires that FEMA submit a report to Congress that evaluates the technological feasibility of mapping Riverine Erosion Hazard Areas (REHAs) and assesses the economic impact of erosion and erosion mapping on the NFIP. This study determines whether it is technologically feasible to map riverine erosion hazards. Based on a literature review, an analysis of case studies, and input from experts, methodologies for analyzing and mapping REHAs were identified. Using cost data associated with existing case studies, FEMA estimated the approximate cost per river mile of conducting riverine erosion hazard studies and adding areas to existing FIRMs. The case studies indicated that there are scientifically sound procedures for delineating riverine erosion hazards, although for shorter time frames (30 years) than the 60 years specified in Section 577. Estimated average study values are $2,000-$3,000 per mile for geomorphic methods, $6,000-$7,000 per mile for engineering methods, and $10,000-$12,000 per mile for mathematical modeling methods. The report estimates that the implementation of this effort as part of the NFIP would cost between $200 and $300 million. This report does not include a cost-benefit analysis.

**Keywords:** agency operations and management, NFIP, strategic planning

**Abstract:** The *Annual Performance Plan* outlines how FEMA’s strategic goals and objectives will be pursued during Fiscal Year 2001. The plan presents 30 annual performance goals for Fiscal Year 2001. Each of these supports a five-year operational objective contributing to one of the three FEMA strategic goals. Some of the objectives include an increase in the availability and effectiveness of natural hazards information and an increase in the availability of loss-estimation and risk-assessment methods and tools. Other activities include working with federal agencies that influence the built environment to develop and implement a consistent federal policy on natural-hazard mitigation; providing incentives and support to the nonfederal public sector to increase disaster resistance; increasing by 20 percent over 2000 baselines the private sector’s
involvement in disaster resistance; and supporting states, tribes, and communities in their mitigation activities. FEMA will also collect and validate building and flood loss data; confirm that the reduction in estimated losses from NFIP activities exceeds $1 billion; continue a systematic assessment of the NFIP’s impact and effectiveness; increase the number of NFIP policies in-force by 5 percent; mitigate repetitive loss properties; and implement measures to reduce the subsidy for pre-FIRM properties to improve the program’s underwriting ratio.

**Keywords:**
agency operations and management, mapping

**Abstract:** This report concludes that FEMA can and should improve its estimates of the cost of the Flood Map Modernization Plan (MMP). In some instances, the agency did not verify data, use reliable cost data, or establish a sound basis for some assumptions. In addition, FEMA did not fully consider savings that could be realized from technology. The report recommends that FEMA validate its mapping needs for mapped and unmapped communities, determine the cost effectiveness of creating or updating maps, track costs related to map modernization so that actual cost data will be available to use in estimating future costs, and present the estimate as a range to better disclose the uncertainty in the assumptions and the financial impact of alternative assumptions. The OIG also recommends that the Mitigation Directorate expedite the incorporation of new flood-study and terrain data collection techniques and include in its MMP the financial impact of partnerships with state and local governments, new techniques for mapping, and technological advances.

**Keywords:**
agency operations and management, federal programs, public assistance

**Abstract:** The document communicates the financial statements and program activities of FEMA for Fiscal Year 1999 and includes the appraisal of an independent auditor. For disasters declared between 1989 and 1999, FEMA has obligations totaling over $26.8 billion, including public and individual assistance, mission assignments, mitigation, and FEMA administration. The report outlines FEMA organization, activities, and programs and evaluates progress to meeting goals. The auditor identified certain deficiencies involving the internal control over financial reporting that could adversely affect FEMA’s ability to record, process, summarize, and report accurate financial data. The OIG concluded that these deficiencies did not constitute substantial noncompliance with the Federal Financial Management Improvement Act (FFMIA) of 1996.

**Keywords:**
NFIP, strategic planning

**Abstract:** In 1998, as part of its ongoing efforts to achieve even higher levels of effectiveness, FEMA decided to solicit input on all facets of the NFIP from partners and customers of the program. The solicitation was implemented through a nationwide Call for Issues. This report summarizes issues related to insurance coverage, public information, floodplain management,
and hazard identification, among others. FEMA responds to each issue submitted with a definitive decision and/or potential action.

**Keywords:**
- mapping

**Abstract:** This compendium lists all the changes made to FIRMs including Physical Map Revisions, Letters of Map Revision, and Letters of Map Amendment during a given six-month period. For each Letter of Map Change, the listing provides the map panel(s) affected, the effective date of the change, case, number, and determination type. For each Physical Map Revision, the listing provides the map panel(s) affected and the effective date of the change. The listing is updated every six months and published in the Federal Register.

**Keywords:**
- Cover America, marketing, NFIP, risk communication

**Abstract:** This document describes the characteristics of the Cover America II campaign. This campaign started in 1999 and will continue until 2003. It replaces the Cover America I campaign (1995-1999). The document announces that to increase awareness, improve attitudes, and increase flood insurance sales, FEMA has "established a brand for the NFIP. It builds on the yellow diamond street sign, which we see everyday, used to warn drivers of upcoming dangers and to change their behavior as a result of the potential danger. Our new brand couples this sign with the message: ‘Be Flood Alert.’ To the right of the sign are the words: ‘National Flood Insurance Program.’ This brand aims to serve as the foundation for all components of the campaign, including advertising, co-op advertising, and public relations, and gives us the opportunity to talk about all aspects of the NFIP, from mitigation to flood insurance. This document describes the 1999 radio and TV campaign and the co-op advertising program. It also lists ‘mat stories’: stories written and distributed to newspapers across the country throughout the year. These articles provide tips about floods, flood insurance, and flood prevention.” The document contains samples of printed ads, testimony of some co-op advertising partners, and some recent mat stories.

**Keywords:**
- legal issues and litigation, legislation, NFIP

**Abstract:** This digest summarizes the holdings of relevant cases that involve the NFIP and to which FEMA, HUD, FIA, the National Flood Insurers Association, companies participating in the WYO program, or local governments were parties. It consists of cases reported in the national (West) reporters, the Commerce Clearing House (CCH) Insurance reporters, and the electronic reporters, as well as significant unreported cases. There may be other significant unreported cases concerning WYO parties, that WYO counsel failed to bring to the attention of FEMA’s Office of the General Counsel (OGC) and FIA. The cases are digested under subject categories including threshold; coverage; underwriting; notice of loss; damages; attorney fees under the Equal Access to Justice Act (EAJA); fraud; subrogation; publication and marketing of
the NFIP; constitutionality, statutory purpose, and structure of the NFIP; and floodplain management and mapping. The citations are to the bound reports, including CCH Insurance reporters if not found in the West reporters, and to one or more electronic reporters if not within the bound reporters. Parallel citations are given when it may be advantageous for the reader’s access.

*Keywords:*

economic impacts, Hurricane Floyd, New Jersey

*Abstract:* This report, completed by the Department of Commerce’s Economic Development Administration at FEMA’s request, is intended to: (a) provide a comprehensive assessment of the economic impacts of Hurricane Floyd on the affected areas of New Jersey; (b) provide recommendations for businesses and state and community officials on how to accelerate the recovery process; (c) implement safer, stronger, and smarter building practices; and (d) create disaster-resistant businesses and jobs. Hurricane Floyd affected more than 76,000 residences and 4,000 businesses in nine counties in New Jersey’s disaster declaration. The assessment focuses on six communities that were most at risk for long-term negative impacts from the storm: the boroughs of Lodi, Bound Brook, and Manville and the cities of Trenton, Passaic, and Paterson.

*Keywords:*

economic impacts, Hurricane Floyd, North Carolina

*Abstract:* This report, completed by the Department of Commerce’s Economic Development Administration at FEMA’s request, is intended to: (a) provide a comprehensive assessment of the economic impacts of Hurricane Floyd on the affected areas of North Carolina; (b) provide recommendations for businesses and state and community officials on how to accelerate the recovery process; (c) implement safer, stronger, and smarter building practices; and (d) create disaster-resistant businesses and jobs. Hurricane Floyd caused approximately $6 billion in economic losses in North Carolina: $1 billion in business structural losses, $4 billion in business revenues; and $1 billion in agricultural losses. Sixty-six of the 100 counties in the state were declared disaster areas, with 44 counties suffering economic impacts ranging from minor to severe. The assessment focuses on these 44 counties. The analysis is divided into nonagricultural and agricultural business sectors.

*Keywords:*

agriculture, compliance, disaster assistance, disaster planning, economic impacts, Hurricane Floyd, insurance purchase decision, mitigation, strategic planning, Virginia

*Abstract:* In September 1999, Hurricane Floyd passed through southeastern Virginia causing severe inland flooding. Subsequent disaster declarations included 43 local jurisdictions. To assist the affected communities in their recovery, FEMA asked the Economic Development Administration (EDA) of the Department of Commerce to undertake a rapid assessment of the economic impacts on agriculture and businesses from Hurricane Floyd. More specifically, the
The primary purpose of the assessment was two-fold: to accelerate business recovery and to support the creation of sustainable business enterprises and disaster resistant jobs. EDA estimated damages of approximately $35 million to businesses and $17 million to crops in the study area (City of Franklin and Isle of Wight and Southampton Counties). The report makes a number of recommendations for economic recovery and sustainability including, but not limited to: increasing flood risk awareness and facilitating the purchase of sufficient flood insurance, buying out and relocating vulnerable businesses from floodplains, and planning ahead for future disasters.

**Keywords:** buyouts, insurance purchase decision, Missouri, North Carolina, property values, public policy

**Abstract:** In 1999 Congress directed FEMA to report on the feasibility and justification of reducing buyout assistance to those who failed to purchase and maintain flood insurance. To examine the policy issues FEMA 1) reviewed research and data related to the factors influencing flood insurance purchase; 2) conducted a field study to evaluate the experience of large buyout programs in Missouri and North Carolina; and 3) sought feedback from the OIG and state emergency management officials. FEMA also assessed the feasibility of implementing a policy to reduce buyout assistance to those who fail to purchase and maintain flood insurance by examining its current procedures and assessing potential implications. Overall, the research and survey work done by FEMA led to the conclusion that no justification exists for reducing buyout assistance to those who fail to purchase and maintain flood insurance. Doing so will not result in any significant increase in the purchase of flood insurance, but will have the unintended consequences of effectively penalizing the low-income populations most in need of federal assistance to move out of harm’s way and of reducing the effectiveness of community’s activities for flood mitigation. FEMA does not recommend taking any action based on the report’s conclusions.

**Keywords:** media, mitigation, Project Impact

**Abstract:** FEMA’s Project Impact: Building Disaster Resistant Communities launched a combined television and radio public service announcement (PSA) campaign encouraging Americans to ask what their community is doing to become disaster resistant. The PSA followed two recent surveys regarding tornado and hurricane seasons. Survey respondents said they felt well prepared for disasters, but that they had not taken any prevention measures to prepare for natural disasters. In hurricane-prone states, 76 percent of respondents in northern states and 58 percent in southern states had not taken any prevention measures. The National Association of Broadcasters, which serves and represents America’s radio and television stations, has taken on FEMA’s Project Impact as a national campaign and will work to promote among its members the importance of prevention measures to reduce disaster damage.

**Keywords:**
California, mapping, Minnesota, mitigation, North Dakota, Project Impact, Red River, Virginia

Abstract: FEMA and the National Aeronautics and Space Administration (NASA) signed an agreement under which FEMA will use NASA science, technology, and remote-sensing research in emergency management and disaster prevention activities. FEMA expected that the cooperative agreement would result in updated and more accurate maps of floodplains, a better understanding of wildfires and maps to improve disaster recovery and mitigation by state and local communities throughout the United States. The first cooperative activity under the agreement involved mapping floodplains in Los Angeles, CA; Sacramento, CA; Virginia Beach, VA; the Red River along the North Dakota and Minnesota border, and San Francisco, CA.

Keywords: Community Rating System, insurance premiums, mitigation

Abstract: This third biennial report submitted to Congress provides an overview of the Community Rating System (CRS) from inception to future directions. CRS was implemented in 1990 to recognize and encourage community floodplain management activities that exceed the minimum NFIP standards. Under the program, flood insurance premium rates are adjusted to reflect the reduced flood risk resulting a community’s implementation of creditable activities.

The report describes the 10 CRS classes (Class I requires the most credit points and gives the largest premium reduction). The report states that over 900 communities received discounted insurance premiums based on their implementation of measures that go beyond the NFIP’s minimum requirements. The report also points out that these communities account for over 66 percent of the NFIP’s policy base.

Keywords: NFIP, repetitive losses

Abstract: This report provides an annual update on the status of the NFIP. It details activities on policies, marketing, claims, and mitigation. At the close of fiscal year 2000, the NFIP covered 4.3 million policies in 19,117 communities. Claims payments on closed losses totaled over $192 million to 19,627 recipients. FEMA’s Mitigation Directorate continued to address the issue of repetitive loss properties by identifying properties and targeting them for mitigation actions such as buyouts, relocation, and elevation. FIA provided a ranked list of more than 11,000 targeted properties to state officials for use in their own mitigation efforts.

Keywords: compliance, floodplain designation, lending institutions, mandatory purchase, mapping, Special Flood Hazard Areas

Abstract: Of the 4,195 structures in the report’s judgmental sample, 416 or 10 percent of the structures did not have flood insurance despite meeting the requirements for mandatory purchase. The report finds 30 percent of structures in the sample did not have coverage and purchase requirements did not apply to 20 percent due to Letters of Map Amendment and Letters
of Map Revision, unregulated lenders, or no mortgage. Data from FIA suggests a non-compliance rate as high as 38 percent overall. The OIG recommends that to enhance compliance, FIA should study compliance levels in the post-disaster (flood) environment, should identify structures that are remapped into a SFHA, should follow-up on lapses of flood insurance policies, and should encourage standards for flood zone determinations. Furthermore, the report encourages FIA to assess the impact of Group Flood Insurance Policies (GFIPs), a mechanism created in 1996 to help disaster victims in SFHAs comply with mandatory purchase, on the reduction of disaster costs.

**Keywords:**
agency operations and management, strategic planning

**Abstract:** This report explains how performance goals for Fiscal Year 2000 contributed to FEMA’s three strategic goals: to protect lives and prevent the loss of property from all hazards, to reduce human suffering and enhance the recovery after disaster strikes, and to ensure that the public is served in a timely and efficient manner. For example, one performance goal calls for the implementation of a repetitive loss strategy to reduce repetitive losses to the NFIP significantly. This performance goal would contribute to the achievement of the agency’s first strategic goal. Some flood insurance-related performance goals include: evaluation of the effectiveness of the mitigation planning process and related initiatives at both the state and local levels, modernization of the floodplain-mapping program, and an increase in the number of flood insurance policies-in-force by 5 percent. The report also details management challenges identified in the Fiscal Year 2000 *Annual Performance Plan* and explains representative Fiscal Year 2000 evaluations.

**Keywords:**
awareness, disaster planning, mitigation, Project Impact, risk communication

**Abstract:** With Project Impact: Building Disaster Resistant Communities, FEMA expects to change the way America manages disasters. Project Impact aims to help communities protect themselves from natural disasters. Project Impact bases its work and planning on three principles: preventive actions at the local level, private sector participation, and long-term efforts and investments in prevention measures. This report explains that in 1997, FEMA partnered with seven pilot communities across the country and was encouraged by the benefits realized and the local commitment that flourished. Project Impact quickly became a national initiative as more communities began to see the value in disaster planning and mitigation. Today there are nearly 250 participating communities, as well as more than 2,500 businesses that have joined Project Impact as partners.

**Keywords:**
disaster planning, federal programs, mitigation, Project Impact,
Abstract: This report assesses the community mitigation grant initiative of NFIP’s Project Impact and reveals several areas where the identification and reporting of partner contributions should be improved. The report recommends that FEMA take steps to increase the accuracy of reported partner contributions by issuing guidance to communities to identify contributions more accurately and consistently and to improve its strategy for reporting quantifiable and nonquantifiable contributions so that valuable attitudinal and behavioral changes in communities are not overlooked. As the number of Project Impact communities grows, the report recommends that “best practice” examples be disseminated to share successful ideas and exemplary tasks and that FEMA realign its resources to better meet the increasing workload placed on regional coordinators. The report further recommends that FEMA educate communities about grant procedures, ensure that communities are selecting viable projects, and more closely monitor mitigation projects using federal funds so that the current trend of communities’ slow spending of federal grant monies can be changed.

FEMA. (2000). 

Recommendations on the Pre-FIRM Subsidy. Washington, DC: FEMA.

Keywords: insurance, pre-FIRM structures, repetitive losses, subsidies

Abstract: The document provides background on the pre-FIRM subsidy, highlights the more important economic effects of subsidy elimination, and contains recommendations developed by FEMA for accelerating the reduction of the pre-FIRM subsidy. The document is a companion to the “Study of the Economic Effects of Charging Actuarially Based Premium Rates for Pre-FIRM Structures.” The study finds that elimination of the pre-FIRM subsidy would impact all NFIP communities, but would most greatly impact communities with relatively high proportions of high-risk, floodprone, pre-FIRM properties. In these communities, premium increases would be significant, property values would decline considerably, and fewer flood insurance policies would be purchased. Additionally, the structures most likely to drop their flood insurance would be the ones at greatest risk, because they would face the highest premium increases. For these reasons, and the potential of reduced savings from increased SBA loans and FEMA disaster assistance, FEMA recommends against an immediate move to actuarial rates. FEMA recommends that subsidies for principal residences be reduced over a long period of time, such as 20 years. However, subsidies for non-principal residences (rental properties, vacation homes) should be eliminated more aggressively over seven years. FEMA requests additional funding and resources to properly target repetitive loss properties, which will aid in reducing subsidies to pre-FIRM properties.

Keywords: cost-benefit analysis, mitigation, strategic planning

Abstract: This report reviews the benefits of mitigation that can accrue to different segments of society, the costs incurred, the types of analyses needed to evaluate cost-effectiveness, the tools of hazard mitigation (including design and construction, land use planning, organizational plans, and hazard control and their implementation), and FEMA’s mitigation programs. Sixteen case studies illustrate the diversity of mitigation measures that can address risk situations. The cases demonstrate that mitigation is effective against several types of natural hazards and can be accomplished through the use different mitigation tools. The report concludes that the mitigation
of hazards is a long-term, community-based undertaking that relies on an investment from all sectors of the community, not just federal, state, and local governments. Mitigation often requires a structuring of incentives and relies on recognition of the risks of natural disasters and the development of new methods to reduce these risks.

*Keywords:* floodplain management, strategic planning

*Abstract:* This report summarizes the proceedings of the Floodplain Management Forum, held on June 8, 2000, in Washington, DC. A diverse group of experts on floodplain management participated in discussions of the future of floodplain management in the United States. Some of the major themes presented (though not necessarily agreed upon) by the participants include: shifting focus from flood-loss reduction to sustainable communities and protection of natural/beneficial functions of floodplains, encouraging and providing incentives for communities to develop master plans and hazard mitigation plans, developing more effective ways to communicate risks to citizens, considering the incorporation of components of CRS into NFIP regulations, and developing methods to improve flood insurance and eliminate subsidies.

*Keywords:* debris removal, disaster assistance, disaster planning

*Abstract:* This report presents results of the OIG’s audit of debris management and identifies the major problems related to debris removal confronting FEMA, states, and communities and FEMA’s efforts to correct them. Local governments generally have responsibility for removing debris following a disaster. However, local governments face challenges to removing debris such as estimating the amount of debris and the cost to remove it, awarding effective contracts, and monitoring the performance of contractors. FEMA helps local government overcome such problems through technical assistance, training, and guidelines. Despite timely efforts, fraud, waste, and abuse do occur. For example, the OIG identified $2.5 million in duplicate payments for debris removal between October 1992 and March 2000. In another case, a subcontractor hired to remove debris in Omaha, NE, intended to increase the amount of debris hauled and thus profit by cutting healthy trees. The contractor then dumped this ineligible debris at official dumpsites. Based on results from the audit, the OIG recommends FEMA provide timely assistance following a disaster requiring debris removal, expand training in debris removal for emergency managers at all levels, explore ways to improve the delivery of technical assistance to state and local officials, develop a mechanism to enter data on debris into NEMIS, and provide relevant parties with written instructions to avoid duplication of payments or benefits.

*Keywords:* buyouts, cost-benefit analysis, Hazard Mitigation Grant Program, Hurricane Floyd, relocation
Abstract: This report summarizes the Office of Inspector General’s findings concerning money allocated for buyout and relocation programs (P.L. 106-113 and P.L. 106-246) following Hurricane Floyd. Congress asked the OIG to determine whether FEMA’s buyout estimates are accurate and to provide an assessment of FEMA’s oversight procedures. The report’s first section focuses on: (a) the process used to identify buyout structures; (b) the method used to estimate the total cost of the buyout; (c) the impact of other sources of disaster assistance on buyout decisions; (d) the process developed for allocating funds; and (e) the procedures used for cost-benefit analysis. The second section addresses concerns regarding the implementation of the Hazard Grant Mitigation Program (HGMP) and develops recommendations for action and issues for further review. The final section of the report recommends ways to improve HMGP.

Keywords:
- floodplain designation
- 1 percent annual chance flood standard
- hydrology and hydraulics
- mapping

Abstract: The final ruling revises the NFIP regulation to include definitions for future conditions hydrology and for FIRMs to display floodplains for community purposes. Historically, flood hazard information presented in FIRMs has been based on the existing conditions of the floodplain and watershed. However, FIRMs have not been updated as regularly as expected and flood hazards in areas experiencing urban growth may change significantly. The report cites the results of Modernizing FEMA’s Flood Hazard Mapping Program: Recommendations for Using Future Conditions Hydrology for the NFIP for specific recommendations. The inclusion of future conditions data is part of the larger Map Modernization initiative as well as an attempt by FEMA to facilitate local and state ownership of flood maps through increased involvement in the flood mapping process. The document also contains comments and recommendations submitted in response to the proposed change in regulation.

Keywords:
- Alabama
- Coastal Barrier Resources System
- communication
- Florida
- legislation
- Rhode Island
- South Carolina
- Write Your Own Program

Abstract: FEMA’s OIG conducted this review of internal controls to prevent the sale of flood insurance to properties within the Coastal Barrier Resources System (CBRS). The OIG reviewed relevant legislation and regulations governing CBRS and the prohibition on the sale of flood insurance to these properties. The OIG also examined files maintained for resolution of policies issued in CBRS and reviewed all policies indicated to be potentially within the CBRS in Alabama, Florida, Rhode Island, and South Carolina. Interviews with officials at FIMA as well as contractors who have a role in CBRS compliance requirements and Write Your Own (WYO) companies involved in the sale of insurance in or near CBRS areas were conducted. First, the OIG found that policies potentially in CBRS were not always fully processed or reported due to a lack of accurate community identification, a low level of confidence in addresses, and outdated data from FIRMs. The OIG recommends that all policies be fully processed using the
Geographic Policy Edit System even when only incomplete information is available and that policies for properties potentially in CBRS be reported to WYO companies and FIMA’s Direct Serving Agent for further clarification. Second, the OIG examined how policies for properties identified as potentially in CBRS are resolved. The OIG found that of the policies examined, about 46 percent had no record of determination. The report recommends that FIMA require resolution of all cases where there is no record and encourage use of the U.S. Fish and Wildlife Service to resolve unclear properties. Lastly, the OIG recommends that FIMA explore the possibility of requiring the resolution of a property potentially in CBRS prior to issuing a policy.

**Keywords:**
mandatory purchase, public assistance

**Abstract:** This inspection assesses compliance with the insurance purchase requirements required by FIMA’s Public Assistance Program, the insurance review process for the program, insurance applicability issues, and possible rule changes for insurance. With respect to compliance with insurance purchase and maintenance requirements, the inspection revealed that 34 percent of the projects were not maintaining insurance, 39 percent of the project files did not contain acceptable evidence of insurance, and some projects were purchasing less insurance than required. With respect to the insurance review process, the report recommends that FEMA take specific steps to improve the quality of the documentation accepted as proof of insurance for projects in order to decrease the likelihood of FEMA providing unnecessary assistance. The report also recommends that FEMA regularly monitor public entities to ensure their maintenance of insurance on public buildings that previously received public assistance. The report proposes an option for a proposed rule that would help eliminate current disincentives, streamline insurance reviews, and encourage state and local governments to obtain insurance coverage.

**Keywords:**
agency operations and management, strategic planning

**Abstract:** This plan outlines the strategic goals and objectives that FEMA will pursue during Fiscal Year 2002. The plan illustrates how FEMA will execute its mission to “reduce the loss of life and property and protect our institutions from natural and technological hazards by leading and supporting the nation in a comprehensive, risk-based emergency management program of mitigation, preparedness, response, and recovery.” The following goals are identified: (a) support the development of disaster resistance in communities and states; (b) collect, validate, and refine building and flood-loss data and confirm that the reduction in estimated losses from NFIP activities exceeds $1 billion; (c) increase the number of NFIP policies in force by 5 percent, with the active assistance of new and existing program partners; and (d) improve the “bottom line” or combined loss and expense ratio by 1 percent.

**Keywords:**
agency operations and management, mapping, strategic planning
Abstract: FEMA developed a plan in 1997 to modernize its program of mapping flood hazards. The plan outlined the steps necessary to update FEMA’s flood maps for the nation to digital format and to streamline FEMA’s operations in raising public awareness of the importance of the maps and responding to requests to revise them. This report summarizes the progress made toward implementing the plan during Fiscal Year 2000 and part of Fiscal Year 2001. Section I overviews the plan and summarizes its benefits and the funding requirements. Section 2 discusses the Cooperating Technical Partners (CTP) initiative to increase formal relations with efforts at the federal, state, regional, and local levels. These relations will result in strengthened mapping and floodplain management programs and thus should reduce losses from floods and disaster assistance. Section 3 explains how technology plays a role in FEMA’s flood mapping program. Digital maps, for example, will allow FEMA to distribute DFIRMs on CD-ROM and through the Internet. The final section of the report discusses the progress made on the various objectives of the plan including the adoption and distribution of revised guidelines on determining flood hazards on alluvial fans.

Keywords: mapping, hydrology and hydraulics

Abstract: This document offers FEMA’s recommendations for the use of future conditions hydrology mapping to address current and potential flood risks. The document emphasizes the role of state and local partners in the map modernization plan. FEMA will provide funds for mapping, technical assistance, and mentoring to the state or local partner, which will then develop and maintain all or a component of its flood map, thus maintaining the connection between mapping and managing flood hazard areas. The report recommends displaying future conditions land use and hydrology on NFIP maps for informational purposes, but leaves decisions regarding their use and regulation to the local community. Specifically, the future conditions floodplain could replace the 0.2 percent annual chance (500-year) floodplain on locally adopted maps. Regarding floodplain management, FEMA will continue to require regulation of floodplain development based on data of existing conditions, while local floodplain managers can regulate development based on future conditions data. The document contains a detailed appendix of procedures for determining future conditions hydrology.

Keywords: agency operations and management, Hazard Mitigation Grant Program, mitigation

Abstract: This report evaluates the status of awards under the Hazard Mitigation and Grant Program (HMGP) and examines factors impacting timely distribution of funds and completion of mitigation projects. The report concludes that the large balance of undisturbed funds is due to the inability of FEMA, state, and local governments to spend available funds and implement projects in a timely manner and it is neither fiscally prudent nor responsible for FEMA to carry such large balances. Another factor is FEMA’s failure to consider state and local capacity before providing grants and the weakness of program designs. The report makes a series of recommendations about how the program could be more effectively implemented, including allocating funds on an annual basis, creating broader incentives for states to expedite mitigation projects, and
establishing a competitive process for deobligated funds. The report finds that FEMA has addressed some of the recommendations made in the report and has made progress in shortening the project approval timeframes, however several recommendations remain unresolved.

**Keywords:**
agency operations and management, dams, economic impacts, federal programs, flood disaster planning, floodplain management, hurricanes, insurance, mitigation, natural disasters, NFIP, relocation

**Abstract:** This document outlines FEMA’s organizational vision and sets goals for Fiscal Year 2003 through Fiscal Year 2008. It introduces a shift in focus to include not only natural disasters but also responses to terrorist attacks. A continued emphasis during this time will be on mitigation and insurance. FEMA presents its goals, objectives, and strategies that will allow the agency to realize its vision. The six main goals are to 1) reduce loss of life and property, 2) minimize suffering and disruption caused by disasters, 3) prepare the nation to address the consequences of terrorism, 4) serve as the nation’s portal for emergency management and expertise, 5) develop and support its workforce, and 6) continue to improve the agency through performance-based management and meeting customer needs. Appendices include an outline of the goals presented throughout the plan, an outline of FEMA’s core values, information on FEMA’s regional office, a summary of major authorities, crosscutting partnerships with other federal agencies (including many in floodplain management and insurance), and a glossary.

**Keywords:**
Community Rating System, floodplain management

**Abstract:** This edition provides an update to the manual released in 1999. It includes the *CRS Schedule*, which sets criteria for CRS classification, and *CRS Commentary on the Schedule*. Section 100 gives general background information on the system. Section 200 explains the procedures for applying for a CRS classification. Sections 300 through 700 explain the credit points and calculations used to verify CRS credit. A community uses procedures in these sections to submit a modification for a better CRS classification. Based on comments and recommendations received by FEMA and the Community Rating System Task Force, the 2002 edition makes several major changes including but not limited to, the attainment of Class 1 status only through a community’s adoption of the “No Adverse Impact” approach to eliminate or minimize future flood losses and the receipt of credit for repetitive losses acquired, retrofitted, or relocated outside the SFHA and the receipt of double credit for those within the SFHA.

**Keywords:**
Community Rating System, floodplain management

**Abstract:** This report presents findings from the OIG on the effectiveness of CRS as a tool to improve the policies and practices of local floodplain management. Data to confirm that CRS activities effectively reduce dollar exposure to the NFIP are currently unavailable. Nevertheless, CRS is a disciplined program with well-defined requirements, clearly written guidelines, and
detailed rating processes and procedures. However, FEMA could further enhance the effectiveness of the CRS program by 1) performing Community Assistance Visits (CAVs) in all CRS communities; 2) marketing CRS to communities having greater exposure to the NFIP; 3) providing credit for increasing insurance coverage in the community; and 4) providing CRS Coordinators with access to claims data. Also, FEMA should consider 1) discontinuing discounts for pre-FIRM properties; 2) requiring insurance to the cumulative level of assistance provided; and 3) requiring a greater commitment to uniform building codes and measurable criteria for entry into CRS. According to the OIG, these actions would not only improve the effectiveness of CRS but also would reduce exposure to the NFIP and lessen disaster costs.

Keywords: awareness, coastal areas, communication, Community Rating System, compliance, enforcement, floodplain management, insurance, NFIP, risk communication, training

Abstract: Human Technology conducted telephone interviews to determine the perceived training needs within CRS communities. Seven communities were contacted and interviewed from each of four categories (large and small coastal communities and large and small inland communities). The report presents a summary of initial findings and the questions and respondent’s verbatim answers. Overall, the survey found that the greatest challenges facing CRS coordinators in implementing floodplain management include compliance and enforcement, educating the public about risk and flood insurance, and inaccurate data. Most of the respondents had previous training in formal workshops, and 72 percent of respondents indicated training could improve CRS participation and floodplain management. Included in the topics they would like to receive training in was training designed to help with compliance issues. Respondents want short, focused workshops that are site-specific (tailored training) and conducted within their locality.

Keywords: agency operations and management, disaster assistance, federal programs, public assistance

Abstract: This report presents results regarding duplication of benefits (DOB) between the NFIP and the Disaster Housing Program’s Minimal Repair Grants. A sample of seven disasters revealed 863 cases of potential DOB totaling $3.5 million. Of these 863 cases of potential DOB, FEMA notified 156 to return funds and received full or partial payments from only 89. Furthermore, data inconsistencies between the NFIP and NEMIS databases impede the efficient and effective identification of potential DOB. Based on these results and observations, the reports makes the following recommendations to FEMA: 1) develop consistent data entry and maintenance standards for key data elements maintained in the NFIP and NEMIS databases; 2) develop an automated interface, data warehouse capability to query key data elements between the NFIP and NEMIS databases prior to paying for minimal repairs; 3) perform post-disaster database comparisons as an interim measure until an automated system is operational; 4) follow up on the DOB cases identified during this review and initiate recoupment action, as appropriate; and 5) enhance the debt collection process under the Disaster Housing Program to ensure the DOB is identified and recovered in a reasonable time frame.
FEMA. (2002). *Extent that Mitigation Funds are Used to Address Repetitive Flood Loss and Other Related Issues*. Washington, DC: Office of Inspector General, FEMA.

**Keywords:**
Hazard Mitigation Grant Program, Flood Mitigation Assistance Program, mitigation, repetitive losses

**Abstract:** As incidents of widespread flooding persist, the number of insured properties suffering repetitive flood losses continues to cause financial hardship for the NFIP. This report assesses the extent to which mitigation funds are being used to address the problem of repetitive flood loss and makes recommendations in three areas. First, HMGP and the FMA Program cannot adequately address repetitive flood loss properties without exemption from or elimination of certain policies including time limits and formulas used for allocating funds. Second, the collection and dissemination of data on repetitive flood loss properties needs improvement with regards to accuracy, consistency, and usability. Finally, FEMA and state officials can better use NEMIS to manage the repetitive loss problem. The report also notes several impediments faced by property owners to mitigate including the inability to share the costs, a lack of knowledge about mitigation opportunities, and the availability of subsidized flood insurance.

**Keywords:**
NFIP

**Abstract:** Formerly called the Stakeholder’s Report, this compendium provides an annual update on the status of the NFIP. It details activities on policies, repetitive losses, claims, mitigation, and CRS. At the close of fiscal year 2001, the NFIP had 4,476,836 policies providing over $617 billion in coverage. Total flood loss payments exceeded $1.2 billion. The report also includes an actuarial rate review that determines operating profit/deficit annually for 1978 through 2000. As part of FEMA’s strategy for targeting repetitive loss structures, payments on repetitive loss structures are reported for each state. The report also contains information on the number and distribution of CRS communities and examples of activities funded by the Flood Mitigation Assistance (FMA) Program and the Hazard Mitigation Grant Program (HMGP).

**Keywords:**
mapping

**Abstract:** This report defines technical requirements, product specifications for FIRMs and products related to the NFIP, and associated coordination and documentation activities. These guidelines combine FEMA technical, programmatic, and administrative procedure publications, guidance documents (listed below), and memoranda regarding the mapping of flood hazards. The guidelines also reflect recent changes to processes and products associated with the implementation of MMP, including the Cooperating Technical Partners (CTPs) initiative and new procedures for scoping projects. Unless specifically indicated otherwise by FEMA for a particular contract or agreement, these guidelines supersede previous FEMA guidelines and documents regarding the preparation of FIRMs, including, but not limited to, the following:
- Flood Insurance Study Guidelines and Specifications for Study Contractors (FEMA 37, January 1995) and any previous revisions thereof;
- Airborne Light Detection and Ranging Systems (Appendix 4B to FEMA 37, May 2000)
- Guidelines and Specifications for Flood Map Production Coordination Contractors (Final Draft, February 17, 1999);
- Guide for Preparing Technical Support Data Notebook (January 1990);
- Guidelines for Determining Flood Hazards on Alluvial Fans (February 23, 2000);
- Guidance for Scoping Flood Mapping Projects (January 12, 2001);
- Guidelines and Specifications for Wave Elevation Determination and V Zone Mapping (March 1995);
- Guidelines and Specifications for Wage Elevation and Determination and V Zone Mapping – Great Lakes (October 1994);
- “Procedures for Collecting, Depositing, and Reporting Fees Under Part 72 of the NFIP Procedures” (undated);
- “Procedures for the Administration of FEMA’s Fee-Charge System” (undated);
- DFIRM Graphic Specifications (November 2000); and

**Keywords:**
Disaster planning, hazard identification, HAZUS, marketing, risk assessment, risk communication, risk management

**Abstract:** FEMA’s mission is to reduce loss of life and property and protect the nation’s built environment from a full range of hazards. To support that mission, FEMA created a risk-based management tool called Hazards U.S. (HAZUS). FEMA developed HAZUS in cooperation with the National Institute of Building Sciences (NIBS), as a nationwide, standardized computer-based tool to assist in planning for and estimating costs due to earthquakes. HAZUS has been expanded to include two new modules for flood and wind hazards. This study was designed to provide external, or “market pull,” and internal, or “market push,” analysis to better understand current and potential HAZUS users and their requirements and to provide a methodology and planning tool for developing training and projections for technical support. The market study considers both existing (earthquake) and evolving (wind and flood) HAZUS Multi-Hazard (MH) capabilities for estimating losses from disasters. The findings of the market study will provide the basis for the formation of a HAZUS MH marketing strategy. Major findings and recommendations include: an analysis of the potential effects of market pull and market push scenarios; insights provided by various user tiers defined by their roles, user organizations, user geography; top five findings from the HAZUS market study presented within the framework of the Four Ps of Marketing (Product, Price, Place, and Promotion); recommendations relating to training and technical support; findings regarding future needs and directions; and recommendations regarding next steps.

**Keywords:**
Insurance coverage, insurance premiums, repetitive losses, Write Your Own Program
Abstract: A preferred risk policy (PRP) has a lower premium than a Standard Flood Insurance Policy and is available for structures located in low to moderate risk areas. A structure loses its eligibility for a PRP if it has received two flood insurance payments or two disaster relief payments, more than $1,000; three flood insurance payments or three disaster relief payments, regardless of the amount; or one flood insurance payment and one disaster relief payments more than $1,000. In this report, the OIG reviewed policies with a repetitive loss history in Florida, Louisiana, Mississippi, Missouri, North Carolina, and Texas to determine which were written as preferred risk. As of March 2002, there were 437 active PRPs providing flood insurance on repetitive loss structures in the sample examined. FIA had not identified 332 or 76 percent of these PRPs as invalid. Furthermore, of the 437 PRPs on structures with a repetitive loss history, 56 or 13 percent had received enough disaster relief payments to make them ineligible to receive a PRP. Based on its findings, the OIG recommends FIMA should analyze the feasibility of using a unique property identifier such as the Tax Parcel Identification Number on paperwork, review monitoring procedures to ensure WYOs resolve errors in a timely manner, and develop consistent data entry and maintenance standards for elements maintained in the NFIP and NEMIS databases.

Keywords: Community Rating System, insurance premiums, mitigation

Abstract: As of October 2002, policyholders in 959 communities receive premium discounts on flood insurance because of implementation of local mitigation, outreach, and educational activities that exceed the NFIP’s minimum requirements. Although premium discounts are one of the benefits of participation in CRS, it is more important that these communities are implementing activities that save lives and reduce property damages. The 959 communities represent a significant portion of the nation’s flood risk; they account for 66 percent of the NFIP’s policy base. The program has been steadily growing over the past five years. CRS communities are improving their practices of floodplain management and receiving better CRS classifications in return. Part 1 of this report provides summary statistics on community participation in CRS and on the cost of administering the program. Part 2 reviews how CRS operates and how the program activities are implemented. Finally, Part 3 describes the progress toward the four strategic goals posed in prior reports: support for mitigation programs, improvement of classification for communities already participating in CRS, encouragement of communities to join CRS, and encouragement of local officials to use an all-hazards approach in planning.

Keywords: agency operations and management, floodplain management, legislation, NFIP

Abstract: The document provides a comprehensive description of the NFIP, intended for use by FEMA staff and NFIP stakeholders. It provides an overview and history of the program and covers all three aspects of the program: floodplain mapping; floodplain management; and flood insurance. Major legislative milestones in the history of floodplain management include the
Flood Control Act of 1936, the National Flood Insurance Act of 1968, the Flood Disaster Protection Act of 1973 and its Mandatory Purchase Requirement, and the National Flood Insurance Reform Act of 1994. The program description contains a step-by-step description of the processing of floodplain management, from the creation of a Flood Insurance Study (FIS) to community adoption of a compliant ordinance to monitoring of community compliance by FEMA and the state. The document also highlights specific initiatives and programs that support the program, including the Map Modernization initiative, the Community Rating System (CRS), the Coastal Barrier Resources System, and the Flood Mitigation Assistance (FMA) program.

**Keywords:** insurance coverage, insurance premiums, risk assessment, submit-for-rate

**Abstract:** There are certain properties at high flood risk that, because of peculiarities in their exposure to flooding, do not lend themselves to the pre-programmed insurance rates outlined in the *Flood Insurance Manual*. These risks require an in-depth underwriting analysis before a risk premium can be applied. Rates for these properties do not appear in the flood manual, but are referred to as submit-for-rate. This guide provides rules and rates for submit-for-rate risks organized into three sections: non-elevated buildings, elevated buildings, and miscellaneous. Overall, the procedures in the guide aim to meet the NFIP’s two-fold goal of establishing sound actuarial rates and obtaining information for enforcing floodplain management.

**Keywords:** agency operations and management, mapping

**Abstract:** This report addresses the work done by three Flood Map Production Coordination Contractors (mapping contractors). The OIG audited $71 million provided to mapping contractors to determine whether FEMA achieved critical mapping goals by using contractors and adequately managed and monitored mapping contracts and costs. The audit revealed that FEMA’s management of mapping contracts needs strengthening. For example, for one mapping contract, 13 invoices totaling $1.1 million were paid using the incorrect funds because accounting staff ignored accounting codes (i.e., funding information) provided by the project officer and assigned incorrect codes to the invoices. Furthermore, the audit also found that while the contractors met some requirements and achieved some goals for mapping, only 16 percent of contract funds were spent on a major goal: updating old maps. According to the OIG, FEMA may have the ability to update more maps if it reduces spending on processing Letters of Map Change, which accounted for 32 percent of contract spending over fiscal years 2000 and 2001, and revises contracting strategies to increase competition and give contractors incentives to control costs. FEMA should give special attention to contractual arrangements for administration and support, which accounted for 27 percent of contract spending.

**Keywords:**
Abstract: The report summarizes legal research and analysis by Dewberry & Davis on legal issues relevant to a determination of whether FEMA can develop a nationwide registry of structural elevation data for NFIP purposes. Specifically, the report identifies and evaluates the significance of potential legal obstacles: the Privacy Act of 1974 and other privacy issues; potential exposure to liability for inaccurate elevation information; and potential ownership rights that third parties may have to elevation data. Dewberry & Davis found no legal issues that would preclude FEMA from establishing and maintaining a national Elevation Registry and making it available to insurance companies and agents writing NFIP policies, or even to the general public. This assumes the Elevation Registry includes specific property addresses, but does not include personal identifiers such as names, policy numbers, or social security numbers. Regarding the contention by WYO companies that such a registry would compromise proprietary customer lists, the registry would contain all addresses for which FEMA had elevation data and would not disclose any company’s customer lists, nor identify whether a property is insured at all. The report adds that FEMA would be obligated by the Freedom of Information Act to make information in the registry available to any person on request. Liability exposure for distributing information about a property is limited to those with an actual relationship to the property or who suffer actual damage as a result of the release of information. The document also describes several strategies for acquiring elevation data.

Keywords: insurance agents, insurance coverage, NFIP

Abstract: The Flood Insurance Manual provides information for use by those insurance companies and agents who write flood insurance policies. This edition, effective May 1, 2003, supersedes all previous editions of the Manual. Some of the changes in the edition include increases to the rates, elimination of the expense constant, an increase to the limit of liability under Increased Cost of Compliance (ICC), and an updated list of communities participating in the Community Rating System. The Manual also lists those communities where the identification of coastal barriers or Otherwise Protected Areas (OPAs) prohibits all federal expenditures or financial assistance, including flood insurance.

Keywords: awareness, Base Flood Elevation, coastal areas, communication, Community Rating System, compliance, disaster assistance, enforcement, floodplain management, insurance, mapping, media, training, repetitive losses, risk communication, riverine areas, Stafford Act, substantial damage, variances

Abstract: FEMA intends to use this report as a basis for future changes in training. The report summarizes the responses of nine FEMA regional staff members, 26 NFIP state floodplain coordinators, and 53 local floodplain management officials to questions about training needs at the regional, state and local level, and provides recommendations to improve training. Recommendations include offering training on-site (in addition to the resident course at EMI), dividing broader topics into smaller “modular” courses, providing training materials in multiple formats, sponsoring opportunities for regional and state floodplain coordinators to meet and
share ideas, developing an advanced NFIP course, mandating that each local community develop administrative procedures (provide training on developing procedures, and a regulation to ensure compliance), requiring training for local floodplain management officials, and providing resources to the communities including official communication from FEMA to local government officials to persuade them of the value of training; simple, visually appealing brochures for local use; and public service announcements for local communities to air on local television and radio. Specific questions addressed in the surveys include the type of training available, the type of training needed, how the need for basic training compares with the need for more advanced training, the barriers that exist to providing or attending training, and the benefits that have resulted from NFIP training.

floodplain management, Illinois, insurance coverage, insurance purchase decision, Kansas, Midwest floods of 1993, Minnesota, Missouri, mitigation, North Dakota, Nebraska, South Dakota, Wisconsin

**Abstract:** The Great Midwest Flood of 1993 was among the most devastating natural disasters in the nation’s history. Flooding destroyed or damaged 50,000 homes and completely inundated 75 communities. A study by the Interagency Floodplain Management Review Committee in 1994 estimated property damages between $12 and $16 billion. This report contains a collection of success stories that document what effective mitigation can do to prevent future flood disasters. Most of these stories come from existing sources. The report also includes narratives from several “veterans” of the Great Midwest Flood of 1993 who had flood insurance policies and subsequently urged other property owners to purchase coverage. Remembering its devastation ten years later may help other property owners and communities at risk from flooding become more aware of the harm that floods can inflict on lives, property, and infrastructure. This tenth-anniversary anthology should also serve as a source of inspiration and encouragement for those communities and property owners at risk from flooding. They can take measures today to reduce their physical and financial risk from flood hazards in the future.

**Keywords:**

hazard identification, mitigation

**Abstract:** The report provides guidance for the protection of schools against natural hazards. Currently, approximately 53 million children in grades kindergarten to 12 attend over 92,000 public schools. The capabilities and needs of school districts vary greatly with respect to school construction and repair and the guidance seeks to take these variations into consideration. The guidance utilizes two core concepts: multihazard design and performance-based design. Multihazard design stipulates that designers understand the fundamental characteristics of hazards and how they interact, so that protection becomes integrated with other design elements. Performance-based design relies on investigation of the specific concerns of property owners and occupants to drive design. The guidance also emphasizes that consideration of hazards impacts
all phases of school construction, from site selection for new construction to repair of existing schools. The document considers general principles and perspectives of design protection against hazards and then addresses the specific threats of earthquakes, flood, and wind. For each threat, the scope, effectiveness, and limitations of current building codes are detailed. This is the first in a series of publications that address hospitals, higher education buildings, multifamily dwellings, commercial buildings, and light industrial facilities.

NOTE: This document was never made final although policies from it have been incorporated into other guidance. Remaining policies will be incorporated into a guidance document currently underway.

Keywords:
building codes, compliance, enforcement, floodplain management, insurance premiums, mobile homes, permits, property values, substantial damage, substantial improvement, variances, zoning

Abstract: This guidebook is designed to assist local floodplain management officials in administering the NFIP’s requirements for substantially improved structures. The document contains a detailed description of the various categories of substantially improved structures, the specific floodplain management regulations that apply to these structures, and how to determine whether a particular structure is considered a substantial improvement. The implications for flood insurance rates under various scenarios are also provided. Several appendices provide additional references and sources of information as well as a list of federal and state floodplain management contacts and a substantial improvement checklist.

Keywords:
federal programs, hydrology and hydraulics

Abstract: This report examines the impact of floodplain management programs and regulations on the Federal Highway Administration and highway agencies. Highway encroachment designs are evaluated for economic risk of regional hydrology, stream hydraulics, potential flood losses in terms of damage to structure, upstream flooding due to backwater, stream erosion, and costs due to loss of transportation route. The analysis found that NFIP regulations are reasonable in some instances and pose a barrier to hydraulic engineering and highway design in others. Executive Order 11296, Flood Hazard Evaluation, compels the Federal Highway Administration to design encroachments built with federal aid consistent with the standards of the NFIP where a floodway has been designated. The most significant problems the survey found were confusion resulting from the complexity of the NFIP, the perception that adherence to NFIP regulations would increase highway costs, and technical deficiencies in mapping to help enforce NFIP regulations. The study notes that the Federal Highway Administration and the NFIP have fundamentally different approaches to reducing flood damages: the former seeks cost-effective solutions to site-specific problems while the latter applies a single uniform definition of minimum standards for all floodplains.

126
Abstract: The status of federal, state, and local floodplain management activity as of mid-1985 is reflected in this revised report and in its findings and recommendations. Like its predecessor, the revised report does not seek to provide specific guidance for meeting federal program requirements. Rather, the report seeks wise decisions and management for the nation’s floodplains to reduce losses of life and property from flooding and losses of natural and beneficial values from unwise land-use. A conceptual framework provides general guidance for decision making at the federal, state, and local levels as well as in the private sector. The strategies and tools for flood loss mitigation and for the preservation and restoration of natural floodplain values are presented in detail. Actions are recommended to facilitate the coordination of management programs dispersed among all levels of government.

**Keywords**: federal programs, floodplain management, Unified National Program

**Abstract**: This document provides guidance by discussing specific and commonly recurring issues and by providing examples that show how to implement the provisions of Executive Order 11988, Floodplain Management; it will not resolve all issues or questions. The guidance, directed at federal agencies, state, and local governments, supplements the still valid floodplain management guidelines issued by the Water Resources Council in 1978. The document is divided into two principal parts. The first provides an interpretation on several issues that continue to present problems to those responsible for implementing the order, and the second represents a series of scenarios that illustrate how to address those issues when implementing the order. Scenarios have been grouped together to provide a broad spectrum of federal actions in the context of the executive order. The categories of federal actions range from those over which a federal agency has direct control to those where responsibility has been delegated to the local level. While the scenarios may appear to be addressing an action undertaken by a specific agency, they are intended to be generic and applicable to federal agencies with similar responsibilities and programs.

**Keywords**: awareness, floodplain management, Unified National Program

**Abstract**: This assessment of floodplain management in the United States is a report to the public and to Congress on progress made toward implementing *A Unified National Program for Floodplain Management*. It states that although a truly unified national program to manage floodplains is not yet in place, great strides have been made in that direction. Awareness of flood hazards, particularly among public officials, has clearly increased, while loss of life and injury due to flooding has been curtailed. Nationwide mapping of flood-prone areas by FIA has resulted...
in the initial mapping of more than 12,000 communities and the restudy of over 1,700 communities since coordinated studies began in the 1960s. Eighty-two percent of all flood-prone communities in the United States have joined the NFIP. Computers are increasingly being incorporated into floodplain management and now facilitate such functions as hydrologic modeling, flood warning, and floodplain mapping. The study also declares that modifying flooding has traditionally been the most popular strategy for reducing floodplain losses because the states or federal government conduct most of the planning, funding, construction, and implementation for structural measures and because local and individual adjustments or sacrifices are minimal. Although there is increased recognition of possible adverse effects of these approaches, they are still needed, particularly to protect existing development. In contrast, the strategy of restoring and preserving the natural and cultural resources of floodplains has had little exposure to date and needs to be better integrated both with other floodplain management tools and strategies and with efforts in other fields, such as river corridor management and pollution control.

Keywords: floodplain management, public policy, Unified National Program

Abstract: This report provides a conceptual framework for floodplain management that includes a statement of overall purpose, definitions, working and general principles, and managerial strategies and tools. The report also suggests setting national goals and a timetable for their achievement, providing for periodic evaluations of the status of floodplain management, defining the roles and responsibilities of each level of government and the private sector. Floodplain management aims to achieve a reduction in the loss of life, disruption, and damage caused by floods and the preservation and restoration of the natural resources and functions of floodplains (which, in turn, lessens damage potential). There are four main strategies for managing floodplains: (a) modifying human susceptibility to flood damage and disruption, (b) modifying the impact of flooding on individuals and the community, (c) modifying flooding, and (d) preserving and restoring the natural resources of floodplains. Under this framework, the decisions of floodplain managers involve choosing the best mixture of strategies and tools, balancing competing uses, weighing costs and benefits, and evaluating various alternatives. To ensure that the result of this ongoing decision-making process is improving the status of floodplains, four broad goals have been recommended, along with a list of objectives that must be accomplished to reach them. The goals include: (a) formalizing a national goal-setting and monitoring system for floodplain management; (b) reducing, by at least half, the risks to life, property, and the natural resources of floodplains; (c) developing and implementing a process to encourage positive attitudes toward floodplain management; and (d) establishing capacity for in-house floodplain management.

Keywords: environmental impacts, environmental protection, floodplain management, hydrology and hydraulics, strategic planning, wetlands
Abstract: This guidebook has been written to introduce officials and citizens at the local level to the basic understanding of natural resources in floodplains and to offer suggestions for creating strategies for wisely managing these areas. The overall objective is to educate community officials and citizens about issues in floodplain management so they can take action toward conserving and restoring the natural resources of floodplains. Whereas case studies will showcase communities that have successfully implemented such projects, a step-by-step formula for universal application to all communities would be unrealistic. Rather, the guidebook is intended as a starting point and a resource for ideas so communities can utilize current knowledge about the natural resources of floodplains in order to customize floodplain management projects to a unique local context. Chapters 2 and 3 provide an explanation of natural floodplains. Chapters 4 and 5 suggest ways to plan for and manage the natural resources of floodplains. The guidebook’s case studies illustrate the variety of approaches that can be taken to avoid future problems in floodplains and show how to take advantage of the assets that rivers and streams offer to a community.

Keywords: Australia, China, United Kingdom

Abstract: In the United States, flooding caused more property damage than any other natural disaster in the 20th century. Compared to other countries like the United Kingdom, the United States has had particular difficulties creating an insurance scheme against flooding. Specifically, the NFIP continues to suffer serious adverse selection problems, and the private risk-bearing market has yet to find an effective way to insure flood risks. Thus the burden of relief payments to alleviate flood damage often falls to FEMA. The article examines methods for managing and mitigating flood disasters and makes recommendations for the U.S. government and private insurance industry to strengthen the flood risk “safety net.” The article profiles the flood insurance market in a number of other countries to glean insight into potentially beneficial reforms for the U.S. system.

Flood Hazard Mitigation Advisory Committee with the Hazard Mitigation Technical Assistance Partnership, Inc. for the South Carolina Department of Natural Resources. (1999). Flood Hazard Mitigation: A Plan for South Carolina. Columbia, SC: South Carolina Department of Natural Resources.

Keywords: floodplain management, mitigation, South Carolina

Abstract: This report discusses the effects of flooding on South Carolina and its citizens and outlines an appropriate strategy for mitigating flood hazards. The mitigation measures drafted and recommended by the South Carolina Flood Hazard Mitigation Advisory Committee take the form of seven general objectives listed in an action plan. The objectives include coordinating state and federal flood mitigation programs so they will operate more effectively and efficiently, providing flood data and maps to support mitigation programs, regulating future development to prevent increasing flood hazards and losses, protecting existing development from flood damage, providing of warning and emergency response activities to protect lives and property during a
flood, supporting and improving local mitigation programs, and providing flood protection information to property owners.

**Keywords:**
mapping

**Abstract:** The Committee on Earth Observation Satellites Disaster Management Support Group “supports natural and technological disaster management on a worldwide basis by fostering improved utilization of existing and planned Earth Observation (EO) satellite data.” This report addresses the use of Earth Observation satellites by floodplain managers and other users and for flash flood analysis and prediction. The report concludes that the potential of high and low resolution polar orbital Earth Resource Satellites have been shown to be an excellent tool for providing hydrological information. A family of satellite-derived products from the operational meteorological satellites (geostationary and polar) for application to general flood and flash flood analysis and prediction is also presented. Gaps in remote sensing capabilities are discussed and future improvements and requirements are presented. The ultimate goal is to integrate geostationary with polar orbital data and to have microwave onboard geostationary satellites early in the next millennium.

**Keywords:**
enforcement, mandatory purchase

**Abstract:** The Flood Insurance Interagency Task Force conducted several studies resulting in a series of actions, conclusions, and recommendations. These include (a) the development of a compliance model checklist to provide a general framework for the comparison of existing flood insurance compliance programs, (b) the development of a catalog of compliance assistance materials to ensure adequate compliance with the laws governing flood insurance, (c) the conclusion that a reasonable degree of standardization of enforcement exists within the organizations responsible for implementation, and (d) the assessment of the reasonableness of fees charged by the flood zone determination industry.

Abstract: Approximately 95 percent of all communities in Florida participate in the NFIP. This guidebook is intended to serve as an educational and informational document for local floodplain administrators. Chapter topics include mapping, regulations, local administration, administrative problems, substantial improvements, variances, enforcement, and related programs. Chapter 9 discusses the Community Rating System (CRS), Flood Mitigation Assistance (FMA) Program, and Hazard Mitigation Grant Program (HMGP). The appendices provide sources of technical assistance and a bibliography.

Keywords: Bangladesh, Colorado, England, floodplain management, mitigation, Oklahoma, Portugal, socioeconomic impacts

Abstract: Planning for floods is a complex endeavor. This paper critically examines the dominance of top-down, scientific, and technical modes of analysis in decision-making structures for flood hazard mitigation. It explores the possibilities of incorporating more diverse and contextual knowledge—emphasizing social and cultural, as well as scientific and technical, dimensions—and creating more democratic forms of decision-making. The community-based mitigation underscored by the author involves the participation of people in the analysis of problems and the development of proposals. Examples from the United States, England, Bangladesh, and Portugal illustrate various approaches, successful and otherwise, to floodplain management.

Keywords: awareness, England, flood disaster planning, socioeconomic impacts

Abstract: The author uses the Northampton (England) floods of Easter 1998 as a starting point for a discussion on the improvement of disaster management processes. In order to create sustainable, disaster-resilient communities, flood management must find a workable balance between technical expertise and social awareness. Specifically, the article makes the following recommendations: 1) ensure public awareness of flood risks is maintained in areas with existing structural flood defenses; 2) ensure emergency management procedures are also adequately addressed in areas with existing structural flood defenses; 3) ensure all social groups are adequately catered for, in all phases of disaster planning and management; 4) ensure emergency/disaster planning and management agencies maintain links with local communities; 5) ensure socially inclusive, participatory disaster planning and management are developed; and 6) ensure interagency liaison and communication procedures are working adequately.

Abstract: The report summarizes a major study of the potential changes in flood risk over the next 100 years and offers options for government and the private sector to respond to them. The motivation underpinning the study is that continuing with existing policies will lead to unacceptable levels of risk in virtually every scenario. Flood damage and floodplain management cost the United Kingdom around £2.2 billion annually. The study examines the future of floodplain management the social, economic, and environmental costs under four scenarios – National Enterprise, Local Stewardship, Global Sustainability, and World Markets – which vary by system of governance and degree of public or private control. Scenarios that utilized top-down, intensive government or market involvement – the World Markets and National Enterprise scenarios – projected significantly higher average annual damages than the other scenarios and cost roughly three times as much to implement flood reduction approaches. The author’s considered the effects of nearly 80 different approaches to reducing flood risks under the four scenarios. The findings of the study are intended to aid stakeholders and the Department for Environment, Food and Rural Affairs in considering the implications for public policy, identifying research priorities, and furthering the climate change agenda.

Abstract: This paper suggests modifications of the method used to delineate floodplains on active alluvial fans for the NFIP, given new data regarding the deviations of channels from the medial radial line at the apex of the fan. The original methodology assumes that every point on an alluvial fan contour had an equal probability of being impacted during a flood event (i.e., a uniform probability distribution was assumed). Data now available imply that a normal distribution better describes the probability of points on an alluvial fan contour being hit during a flood event. Results from an example of the application of the modified methodology are compared with the results obtained using the original methodology.

Abstract: By 1979, many communities and regional agencies had become involved in floodplain management as a result of the NFIP, the Coastal Zone Management Program, numerous state programs, and the initiative of local citizens. This report describes current practices in floodplain management in these agencies. At the local level, low levels of public education among land developers and property owners were the largest obstacles to better land use management. Lack of state and federal financial support was the most serious obstacle for regional land use management in floodplains. However, state and federal agencies are significant providers of technical assistance to local and regional bodies. Eighty percent of local agencies reported that they had received technical assistance from the NFIP. The survey also includes data on how local communities judged the effectiveness of the program, highlighting encroachment on natural areas and exposure of existing development to flood damage as among the major problems
The data presented were derived mainly from two mail surveys conducted in 1979. The first survey was directed to a sample of local agencies involved in the NFIP. Members of the National Association of Regional Councils received the second survey.

Keywords: development, economic modeling, housing markets, Minnesota, North Dakota, 1 percent annual chance flood standard, property values

Abstract: This study uses the hedonic valuation method (HVM) to quantify the impact of the threat of flooding on housing values in Fargo, ND and Moorhead, MN. Prices of 3,783 Fargo-Moorhead homes sold between 1995 and 1998 were regressed against structural housing characteristics, neighborhood and environmental indicators, and three flood risk variables. It is difficult to assess the cost effectiveness of flood control projects because uncertainty regarding how flooding, or a reduction in the threat of flooding, influences housing values. Accounting for differences in structural housing characteristics, neighborhood and environmental indicators, and several flood risk variables, being located in the SFHA lowered the sale price of an average home by $8,990. The average sale price of a home was $100,139. Approximately 81 percent of the price depreciation was associated with the cost of required flood insurance premiums: fear of flooding risks accounted for the remaining 19 percent. After the extensive 1997 flood, homes in the 1 percent annual chance floodplain were on average priced $10,241 less than similar homes located outside the floodplain were before the 1997 flood event. Publicity subsequent to the 1997 flood was responsible for average homes in the 1 percent annual chance floodplain being reduced by an additional $1,350. In contrast, homes in the 500-year floodplain on average sold for $3,100 more than similar homes not in the floodplain. It was concluded that homebuyers in Fargo and Moorhead place a value on flooding risk, that more disclosure is needed regarding the location of the 500-year floodplain, and that substantial housing-related benefits are likely to be generated by various flood mitigation projects in the area that result in a redesignation and reduction of the 1 percent annual chance floodplain.

Keywords: Coastal Barrier Resources System, development, environmental impacts, Florida, NFIP

Abstract: This memorandum states that the NFIP has more than 3.8 million policies along the nation’s coasts and rivers, with a potential liability of over $400 billion. This report argues that reforms to the NFIP enacted in 1994 have provided limited benefits. Furthermore, a provision included in the 1996 Omnibus Parks bill exempted eight Florida beaches from CBRS. This provision allowed developers to obtain flood insurance (which can cover storm damage) for disaster-prone beachfront properties. Thus, the NFIP hurts both taxpayers and the environment by inducing development in floodplains.

disaster planning, flood control, levees, risk communication, risk management

**Abstract:** This international workshop examined the risk management measures taken in the past to minimize loss of life and property damage in the event of large-scale flooding of a city by river or sea water, following partial or complete collapse of a levee. It was also intended to identify proper techniques and counter measures by discussing national and international risk management for floods in the context of actual cases of large-scale flooding in which the risk of flooding was minimized. The following topics were discussed in the workshop: floods (forecasts, analysis, and case studies); mechanisms of levee breach and design standards for levees; emergency management systems, including sharing roles by national and municipal governments; development of hazard maps and their usage; information release, evacuation, rescue, volunteer activities, and flood fighting; secondary damage; flood insurance and land acquisition; law suits against flood damage; use of floodplains and restrictions on their use; flood control without disturbing the natural environment; and basin-wide flood control and management. The papers fall into two categories: those written by senior engineers who have had responsibility for managing major floods in different countries and have experience in making decisions on mitigating flood risks and those written by researchers who investigate the management of floodplains.

**Keywords:**
floodplain management, floodproofing, relocation, structural approaches

**Abstract:** As a result of the development of the floodplain, both for agricultural and recreational purposes, the nation faces three major problems: (a) people and property remain at risk, not only in the floodplains of major rivers, but also throughout many other areas in the nation; (b) many regions face severe ecological consequences due to the loss of habitat in riverine areas; and (c) the division of responsibilities for floodplain management among federal, state, tribal, and local governments lacks clear definition. This article summarizes the conclusions and recommendations from *Sharing the Challenge*, issued by the Interagency Floodplain Management Review Committee in 1994. The committee recommended supporting a strategy that avoids unnecessary human use of the floodplain, supports permanent evacuation of flood-prone areas, floodproofs structures remaining in the floodplain, creates additional natural and artificial storage, and provides adequately sized and maintained levees and other structures.

Midwest floods of 1993, floodplain management, flood damage, risk assessment
Abstract: During the summer and fall of 1993, people throughout the world learned of the devastation brought on the Midwest of the United States by what became known as the “Great Mississippi Flood of 1993.” Since the early days of the twentieth century, the United States has labored to reduce the population’s vulnerability to flood damages and yet this flood destroyed tens of thousands of homes, flooded hundreds of thousands of acres of prime farmland, and disrupted the economic and social fabric of several million people. National leaders as well as private citizens not only raised questions about how such flood damages occurred, but demanded to know what should be done to prevent recurrences of these damages. This paper discusses the 1993 flood in terms of its extent and its impacts on the affected region and its populace and describes the conclusions reached by the White House’s Interagency Floodplain Management Review Committee as to the causes of the flood, and regional and national efforts in floodplain management. It concludes with a discussion of the Review Committee’s recommendations concerning research that should be conducted to reduce the potential for repetition of similar natural disasters.

Keywords: economic impacts, environmental impacts, floodplain management, Midwest floods of 1993, public policy, riverine areas, socioeconomic impacts

Abstract: Over the past 30 years, average annual riverine flood damages have exceed $2 billion. Damages associated with the Midwest floods of 1993 exceeded $12 billion and these costs do not include the nonquantifiable, human impacts of this disaster. In a report submitted to the White House in June 1994, a federal interagency floodplain management review committee proposed better ways to manage the nation’s floodplains. The committee indicated that the 1993 flood was the result of a significant hydrometeorological event, that federal flood control efforts in the Mississippi basin had prevented nearly $20 billion in potential damages, and that, in spite of flood-damage reduction efforts, people and property remain at risk due to inevitable future flooding. The committee also recommended that the division of decision and cost-sharing responsibilities among federal, state, and local governments be more clearly defined and that the nation adopt a strategy of avoiding inappropriate use of the floodplain, minimizing vulnerability to damage through both nonstructural and structural means, and mitigating damages as they occur. The report did not call for abandonment of human use of the floodplain but argued for full consideration of the economic, social, and environmental costs and benefits of all future floodplain activity.

Keywords: Cover America, marketing, NFIP, risk communication

Abstract: In 1995, FIA contracted for the initiation and implementation of a nationwide marketing and advertising campaign called Cover America. The purposes of the program were to establish the importance and value of flood insurance in the minds of consumers, stimulate demand for flood insurance, and provide opportunities for other NFIP stakeholders to communicate with the market. The bulk of the 43-month program (May 1995 through December 1998) consisted of media advertising, direct mail, and public relations. This report summarizes
the results of an independent review that FEMA requested on the effectiveness of the Cover America campaign. The report concludes that the campaign has successfully met its objectives. More specifically, the report states that Cover America has positively influenced consumers. It has increased awareness, changed attitudes, generated intermediate actions like information requests, and produced desired outcomes, including sales. Awareness of NFIP has also increased. Before the campaign, 52 percent of respondents said they had never heard of NFIP. Most recently, 43 percent of respondents said they had never heard of NFIP. However, the proportion of respondents who have never heard of FEMA has remained generally unchanged since the Cover America program was launched. Similarly, the positive image of NFIP has improved during the advertising period, from 18 to 30 percent, while the positive image of FEMA has stayed the same. Among those aware of NFIP, positive image has improved 16 percentage points and among those aware of FEMA, positive image has improved 8 percentage points.

**Keywords:** communication, media, Midwest floods of 1993

**Abstract:** This article contrasts national and local press coverage between July 1 and August 31, 1993, of the “The Great Flood of 1993,” exploring major themes used to explain the disaster and to describe the impact of flooding on the people of the Midwest. Coverage in *Time, Newsweek,* and *The New York Times* focused on depersonalized economic costs of the flood, framing the flood in political terms such as entitlement programs, while the regional *The Des Moines Register* focused on the flood’s impact on individuals, families, and communities. The main theme of all the flood discourse was a fight with Mother Nature. Subthemes were (a) technological progress (especially in the national media), with a counter-theme of skepticism of technology; (b) national and personal cost, with a secondary theme of the cost to the taxpayer (the national media suggested that flood insurance is a federal bailout, while local media took a more positive approach); and (c) the politics of compassion (including the concern and support of elected officials and celebrities), which the national media regarded as undermining self-reliance. The author suggests that personal stories are important in covering disasters in that they help readers understand and relate to the event.

**Keywords:** insurance coverage, mandatory purchase, North Dakota,

**Abstract:** This study determined that one-quarter to one-third of flood-damaged properties in Grand Forks, ND, required to have flood insurance did not have coverage. The outcome is significant in terms of the flood event and study timeframe because it follows the National Flood Insurance Reform Act (NFIRA) of 1994. NFIRA intended to strengthen the requirements for the mandatory purchase of flood insurance originally by the Flood Disaster Protection Act of 1973.

**Keywords:** disaster planning, Hurricane Andrew, Midwest floods of 1993, natural disasters, risk assessment, risk management, socioeconomic impacts
Abstract: This project explores the political economy of catastrophic risk from natural disasters in the United States. Unlike previous work on disaster behavior, this dissertation highlights the importance of heterogeneous behaviors on the part of citizens. The project begins by surveying the dominant economic and psychological theories of individual choice about risk. Hypotheses about risk perception and decision-making are developed and quantitative analysis follows using data from disaster losses and hazard insurance. Findings indicate that individuals respond to risk exposure, use availability as a heuristic for evaluating risk, and tend to seek uncertainty with respect to disaster risk. A formal model of individual decision-making about risk management strategies is developed and psychologically realistic actors are introduced into the game. Using an informational cascade model, the analysis shows that communities facing similar objective risk exposure may respond in remarkably different ways. Allowing for biased actors in the game can either increase or decrease the probability that the group will adopt the optimal strategy, depending on the type and magnitude of the bias. Empirical testing of the cascade model relies on a regression equation and county-level data on risk management decisions, demographics, and natural hazard losses. Estimation proceeds using a mix of Maximum Likelihood (ML) and Markov Chain Monte Carlo (MCMC) methods, and the analysis offers preliminary support for the model. The project concludes by inquiring about the effect of citizen decision making on the evolution of political institutions. Using historical data and basic quantitative analysis, the project offers a positive account of the legislative framework for catastrophic risk regulation. The project highlights the importance and potential benefit of jointly analyzing cognitive bias and strategic environment.

Keywords: Australia
Abstract: The paper analyzes preparation, damage, and recovery for a flood in the central business district of Kempsey, Australia in 2001 that resulted in $2.5 million in damage to 94 businesses. The author notes that greater damage potential exists in the commercial sector than among residential properties, though commercial flood damage theory is in its infancy. Thus there is a need for detailed studies of significant commercial flood damage. The study found that warning systems were effective in reducing tangible and intangible damage. However, business-owner satisfaction with warning systems was low: most individuals who were surveyed desired personal warnings, with a high degree of clarity and accuracy. Indirect damages were substantial as well. Thirty percent of businesses suffered prolonged hardship and lost sales total $2 million, with a net profit loss of $200,000.

Keywords: Australia, awareness, disaster planning, economic impacts, flood disaster planning, risk assessment, risk management
Abstract: Recent research suggests that flood warning systems frequently fail to produce maximum benefits, particularly among businesses. Commercial institutions exhibit a lack of flood preparedness. One method of increasing commercial flood preparedness is the development of comprehensive flood action plans that help businesses identify their flood risk, plan a course of action to reduce that risk, implement the various aspects of the risk-reduction plan, and continually review and update their awareness of flood risks and their risk-reduction plan. The article concludes that comprehensive flood action plans have a high potential to reduce the damage from flooding suffered by the commercial sector and should be used by businesses to reduce their flood risk and improve business continuity.

Keywords: liability, NFIP
Abstract: The author argues that the NFIP, which has three goals—to limit government spending on disaster relief, to curb development in floodplains, and to provide insurance to residents of flood hazard areas—has not succeeded. The author argues that development in floodplains continues, while participation in the flood insurance program remains poor. Furthermore the NFIP, according to the author, may be one of the biggest domestic liabilities, next to Social Security.

Keywords: mapping, Tennessee Valley Authority
Abstract: This report recommends mitigation of flood hazards through land-use and structural regulations. The report identifies the experiences of the Tennessee Valley Authority as an example of comprehensive planning for development of floodplains. Flood damage potential, tied to the rate of development, has outpaced the considerable spending for structural approaches to flood hazard mitigation. The study reports that $5 billion was spent between 1960 and 1963 to protect against floods and that an addition $10 billion would be needed to protect the remainder of the 2,000 cities subject to flood hazards. The experience of the Tennessee Valley Authority is particularly pertinent because of its exchanges of land use and flood damage data with local and state governments.

Keywords: Coastal Barrier Resources System, development, Florida, legislation, North Carolina
Abstract: At the time of this study for the Department of Commerce, the Coastal Barrier Resources Act (CBRA) was two years old. The author sought to identify initial impacts of CBRA. He conducted two case studies, made inquiries directly to insurance and financial organizations, and sent a survey to authorities in three states. He says withdrawal of federal flood insurance from Topsail Island, NC, clearly deterred development, so much so that local developers tried unsuccessfully to sue to get their lands removed from the designation so they could regain access to flood insurance. Withholding federal funds for infrastructure was also having an effect. The author found that on Hutchinson Island, FL, local authorities placed a
moratorium on new projects referred and denied several pending proposals when they found that federal help would not be forthcoming to improve the carrying capacity of bridges serving the barrier island. From his surveys, Godschalk predicts a range of possible effects of the CBRA’s limitations, including increased development in already developed areas or a shift from reliance on federal insurance coverage. The most common response, however, was that the effects of eliminating flood insurance and other federal assistance are not yet apparent, overall impacts have been either minor or neutral to date.

**Keywords:** coastal areas, Hurricane Alicia, Hurricane Camille, Hurricane Frederic, hurricanes, mitigation, public policy

**Abstract:** This is a study of coastal storm hazards and related policies. The authors outline a strategy for overcoming obstacles to safeguarding people and property and conclude that federal policies encouraging development in vulnerable coastal hazard areas must stop. They advocate withholding disaster assistance and federal flood insurance from areas that have disregarded previous hazard-reduction requirements. The book discusses coastal storm risk as a policy problem; alternative approaches to mitigating coastal storm hazards; mitigation measures after hurricanes Camille, Frederic, and Alicia; federal and state mitigation programs and policies; local mitigation tools and techniques; mitigation practices in high-hazard coastal localities; and influences on mitigation priority, adoption, and effectiveness.

**Keywords:** California, Florida, Hazard Mitigation Grant Program, Hurricane Andrew, Hurricane Bob, Iowa, Massachusetts, Midwest floods of 1993, Missouri, mitigation, Tennessee

**Abstract:** This book begins by describing the importance of natural hazard mitigation and describing the history and evolution of mitigation and disaster assistance policy. Next, it describes in detail six natural disaster cases, including Florida after Hurricane Andrew, Missouri after the Midwest Floods of 1993, Iowa after the Midwest Floods of 1993, California after the Loma Prieta and Northridge earthquakes, Massachusetts after Hurricane Bob and other storms, and Tennessee after a series of floods and storms. The book also assesses the national mitigation system and FEMA’s Hazard Mitigation Grant Program. Finally, it provides ethical guidelines for hazard mitigation and planning for sustainable communities.

**Keywords:** homeowners insurance, Florida, New York, catastrophic coverage

**Abstract:** The authors estimate the demand for homeowners insurance in Florida and New York, with indicated loss costs as a proxy for the quantity of real insurance services demanded. They analyze the demand for coverage of catastrophic peril coverage and the demand for noncatastrophic coverage separately. The results are relatively consistent in New York and
Florida, including evidence that catastrophic coverage demand is more price-elastic than noncatastrophic coverage demand. They also find evidence that consumers value options that expand coverage, buy more insurance when subsidized through regulatory price constraints, and consider state guaranty fund provisions when purchasing insurance.

Keywords: Australia, modeling

Abstract: This chapter of the assessment of community risk in Cairns analyzes the flood risks facing the community and notes that there are many potential causes of floods in the area. Though the unique hydrology and topology of Cairns serve to protect the area from massive floods, the community is at risk of river catchment flooding. River catchment flooding in the area is influenced by the amount and intensity of rainfall, how much and which parts of the catchment receive rain, and the state of the catchment before the rain. The chapter proceeds to examine the Cairns flood experience, noting major floods that have occurred in the area’s history. The chapter describes a number of flood risk scenarios and notes the effect on the area in each scenario for floods of varying intensities. For example, the author notes that a 2 percent annual event probability flood scenario is likely to impact 755 buildings and 50 kilometers of road, whereas a 0.2 percent annual event probability flood scenario could effect as many as 3,000 buildings and more than 10,000 people.

Keywords: England, flood control, floodplain management

Abstract: Responsibility for flood management in England and Wales falls to a number of different companies and public authorities. Historically the linkage and interactions between water and land management have been weak and demonstrate little consideration for how land development impacts the water environment and flood risk. Ideally, flood management would be directed by a combination of climate characteristics, catchment characteristics, and the socio-economic characteristics of the area being developed. However, institutional constraints on the governments of England and Wales have caused flood management based solely on the above factors impractical. The competing priorities of the authorities responsible for state and local rivers, the private companies responsible for sewage systems, and the land owners responsible for on-site drainage make coordinated efforts at responsible land use and development nearly impossible. In response to this problem, the author suggests creating catchment management committees that include all the flood management stakeholders to help facilitate coordination between them. He also endorses a flood management strategy that combines runoff control, storage, improvements, land-use control, and warnings to minimize potential flood damage in the future.

**Keywords:** Dams, economic impacts, environmental impacts, flood control, flood damage, floodplain management, risk communication, socioeconomic impacts, strategic planning

**Abstract:** This report discusses the management of floods and the identification of appropriate strategies for local conditions. It also analyzes the role of dams as part of a comprehensive approach to managing the risks posed by floods. The appropriateness of a particular strategy varies according to the nature of the flooding and to the presence of other conditions in the local environment. The approach recommended in the report is necessarily comparative: the only way to identify the role of dams in floodplain management is in the context of the appropriate roles of all other options. Moreover, the most appropriate local strategy will often consist of a combination of measures, one of which may or may not involve a dam. A logical approach begins by analyzing the nature of flooding in an area, identifying available options, comparing these in terms of their contribution to the society’s objectives, and finally selecting the best options. Discussion on identifying and overcoming potential barriers to sustainable floodplain management appears in the last chapter of the report.

**Keywords:** insurance industry, public policy, United Kingdom

**Abstract:** The report addresses the relationship between government and the private insurance industry, a relationship that varies between countries from “parasitic” to “symbiotic.” The report describes the relationship between the insurance industry and government in the United States as the former: “the government bears the risks and the industry takes all the profits.” In the United Kingdom, there is mutual dissatisfaction with the informal relationship between government and the insurance industry. Proposed changes to either government policy or insurance industry practice must take into account the reactions of the other party, and seek to maximize that relationship for the benefit of society as a whole. Government is primarily concerned with holistic floodplain management and the evaluation of public expenditures in terms of economic, environmental, and social desirability. The insurance industry, in contrast, is concerned primarily with average annual losses, and the catastrophic loss potential: any public-private partnership needs to recognize their different goals and capacities. However, these differences may also serve as complementary strengths. Government possesses regulatory and land-use planning powers, while the insurance industry combines a risk-based perspective with customer-service experience. The report outlines potential consequences to both government and the insurance industry from; 1) changes in coverage provided for individual properties, 2) changes in the nature of insurance coverage, such as the creation of a tiered system with varying subsidy levels, or 3) changes in an aspect of government policy, such as building standards, or the adoption of higher standards of flood protection.

Keywords: Army Corps of Engineers, modeling, risk assessment
Abstract: This book describes and provides procedures for flood-damage reduction studies conducted by the Army Corps of Engineers. The guidance presented and procedures described in this manual apply to all elements including major subordinate commands, labs, and field operating activities having civil works responsibilities. The procedures described herein lead to estimation of expected benefits of proposed plans to reduce flood damages using risk and uncertainty analysis. Quantitative and qualitative methods of representing the likelihood and consequences of exceedance of the capacity of selected measures are also included.

Keywords: history, NFIP
Abstract: This article discusses the development and history of the NFIP, presents problems, and suggests solutions. The author reviews the three stages of implementing the program at the local level. The article also poses problems of the NFIP in the context of the Disaster Relief Act and examines the effects of three cases, known as the trilogy cases, to the NFIP. The author concludes with a discussion of other existing measures being implemented to improve the NFIP.

Keywords: economic modeling, housing markets, lending institutions, mandatory purchase, property values, Texas
Abstract: This study examines how enforcement of the mandatory purchase provisions affects the selling price of homes and the residential real estate market. The author obtained data from 4,686 home sales in Abilene, TX, between 1989 and 1992. Besides sale price, the dataset included sale date, size, age of house, percentage of high school graduates in neighborhood, flood frequency (10-, 25-, 50-, 100-, 200-, and 500-year frequencies), value of insurance premium, and whether the lending institution enforced the flood insurance purchase requirement. Of the 4,686 properties, 550 had flood insurance policies in effect in 1993. The author retained 3,724 sales in the dataset because the remainder had incomplete data. Sale prices ranged from $1,500 to $450,000 with a mean of $51,000, which suggests a heterogeneous housing market. The author fit both linear and log-linear hedonic price models to the dataset. Results show the log-linear models had a higher R-squared than the linear models. The author then ran three log-linear models in which the flood-related variables differed: 1) only a dummy variable of whether the house was in the 1 percent annual chance floodplain, 2) flood frequency only, and 3) insurance premium index and whether the lending institution enforced the mandatory purchase requirement. All of these variables had significant coefficients. Enforcement of the insurance purchase requirement had the highest coefficient indicating it has the strongest influence of the flood variables considered. The regressions confirmed the original hypotheses.

Keywords:
economic impacts, flood damage, urban areas

**Abstract:** Passage of the Flood Insurance Act of 1968 has prompted the consideration of local flood protection projects. Engineers and local agencies need consistent methods to estimate flood damage in order to perform feasibility studies. Federal agencies have a great deal of data and experience in making damage estimates, but no comprehensive guides are available at the local level. This article presents curves of flood damages for different types of residential structures. The relationships used by FIA are shown to be reasonable and are recommended for use as approximate guides.

**Keywords:**
Colorado, floodplain management, mitigation

**Abstract:** The author describes how floodplain management efforts in Fort Collins, CO, reduced the loss of life and property damage after a massive flood struck the city on July 28, 1997. He discusses the background on the city’s floodplain management program, the positive effects of pre-disaster mitigation, the adoption of a storm-water basin map, and the identification of floodplains in the city’s Master Drainageway Plans.

**Keywords:**
California, Colorado, economic impacts, Midwest floods of 1993, North Dakota, Pennsylvania, socioeconomic impacts, South Dakota, West Virginia

**Abstract:** This paper states that social science research following disasters is limited and outdated: most of the few longitudinal studies are 25 years old. The paper summarizes the existing research efforts on these impacts and reviews the actual impacts from nine extreme events (including: 1889 and 1997 Johnstown, PA; 1972 Buffalo Creek, WV; 1972 Rapid City, SD; 1976 Big Thompson, CO; the Midwest floods of 1993; 1990 Yuba City, Linda, and Olivehurst, CA; and 1997 Grand Forks, ND). The paper also provides recommendations for future research. Some of the most difficult questions that need to be addressed are: (a) What time frame constitutes long term? (b) How can the social and economic effects of a flood be isolated from other local, regional, and national factors? (c) How can the negative effects of a flood on a neighborhood be evaluated when they may be overshadowed by prosperity at the community level? Finally, the author suggests that disaster prevention needs to address economic and political issues, not only geological and meteorological aspects. Consequently, the links between social and physical science need to be developed.

**Keywords:**
Communication, Missouri, risk assessment

**Abstract:** This article explores the relationship between warnings and litigation. It examines a case study in St. Louis to analyze where technological and scientific limits are reached and
where legal liability begins. The authors make recommendations for future research concerning warnings. Four conclusions follow from their analysis: (a) forecasting accuracy is not precise; (b) natural and technological hazards are inextricably linked; (c) more precise forecasts and more confidence in the forecasts might have allowed the company studied (Phillips) to avoid the problems that ensued when its propane contaminated a river; and (d) the severity, frequency, and “fault line” of a flood are more predictable than other natural disasters and should be acknowledged. The article calls for research that addresses the links between technological and natural disasters, as well as the relationship between technological sophistication and forecasting accuracy.

**Keywords:** communication, media, risk communication

**Abstract:** This article reports on the growing value of Internet resources for the emergency management profession. The analysis has six components: (a) a brief history of the field prior to the introduction of the Internet; (b) an overview of the changes in emergency management since the introduction of the Internet and a summary of the characteristics of Internet communications; (c) some descriptions of how the Internet is currently used in flood, earthquake, and volcano research; (d) examples of Internet use as a tool for education; (e) federal and state employment of the Internet in emergency management during disasters and for public education and awareness between disasters; and (f) conclusions and suggestions for future research.

**Keywords:** hydrology and hydraulics, mapping, Special Flood Hazard Areas

**Abstract:** FEMA uses Flood Insurance Studies (FISs) to acquire flood risk data through hydrologic and hydraulic studies. Currently, FISs have been completed for virtually all of the 21,400 communities with flood risks. The results of each FIS are utilized by FEMA’s Technical Evaluation Contractors to prepare FIRMs. These maps depict the spatial extent of Special Flood Hazard Areas (SFHAs), areas subject to inundation by the 1 percent annual chance flood, and other thematic features. The FIRM provides the basis for the NFIP’s activities related to floodplain management, mitigation, and insurance.

**Keywords:** environmental impacts, environmental protection, floodplain management

**Abstract:** The authors point out that, although we understand all too well the damage floods do, we have not, until recently, understood well the many beneficial aspects of flooding. Floods are critical for maintaining and restoring many of the important services provided to humans by riparian ecosystems. It has become apparent that floods present us with a paradox: we want to prevent them because they threaten our lives and ways of life yet we find ourselves searching for
ways to allow or even reintroduce flooding, because it supports the biological infrastructure that makes valued aspects of our lives possible. Thus flood control as it currently stands cannot be effective over the long term. Rather, the key is a new, more informed kind of flood management that works with instead of against the forces of nature.

Keywords: hurricanes, Special Flood Hazard Areas, flood insurance, Florida, Hurricane Andrew, natural disasters

Abstract: This paper uses one of the strongest hurricanes ever to hit the U.S., Hurricane Andrew in 1992, to define a quasi-random experiment that permits estimation of homeowners’ incremental willingness to pay to reduce the risk of severe weather events. Lee County, Florida did not experience damage from Andrew. The storm was a near-miss. The authors hypothesize that Andrew conveyed risk information to homeowners in the county. A difference-in-differences (DND) framework identifies the effect of the information on property values for areas likely to experience significant flood damage. The DND findings indicate at least a 19 percent decline in home property values. The authors also show that conventional hedonic estimates for the same home are incapable of distinguishing coastal amenities from the effects of the risks posed by hurricanes.

Keywords: compliance, geographic information systems, lending institutions, liability, mandatory purchase, mapping

Abstract: New flood legislation not only exposes lenders to the risk of financial penalties for noncompliance but also now dramatically increases the risk of lawsuits by borrowers arising from inaccurate determinations. Thus, lenders must take the accuracy issue seriously. While there are many ways of determining whether a property is in a SFHA, accuracy can be improved by utilizing more specific sources for locating the property and by cross-checking data. Mapping determination processes range from strictly manual to fully automated. Three general categories of automated systems exist. First, the probability system assesses the probability that a given property is in a SFHA. Second, flood mapping systems that rely on GIS generally require two distinct layers of information: a flood map layer and a secondary source street map layer. Third, a process called digitizing converts paper FIRMs into digital flood maps for use on a computer. FEMA has begun to release some digital flood maps.

Hampson, Rick. (2000). So many people – And nowhere left to run. USA Today, July 25.

Keywords: disaster planning, Florida, hurricanes

Abstract: The U.S. coastline has become too crowded to evacuate everyone safely when disaster strikes. Evacuations must begin earlier, when there is still uncertainty about a storm’s path (three-quarters of evacuations turn out to be unnecessary). A two-decade lull in hurricane activity may be ending, sea levels are rising, and a surprising number of people don’t flee hurricanes. Lee County, FL, has considered several unconventional and controversial approaches: (a) public
storm shelters (not endorsed by the American Red Cross) in areas that could be inundated by strong hurricanes; (b) refuges of last resort (which some believe encourage people not to evacuate); (c) growth controls; (d) review of new construction; and (e) storm-proof parking garages. Lee County is also trying to develop an “evacuation culture,” in which the threat of disaster is taken seriously. This would involve an evacuation plan for each family, houses with “safe rooms” for sitting out weaker storms, and interstate highways with lanes that can be easily converted to move away from the storm. The article provides estimated evacuation times during peak tourist season for a Category 4 hurricane for 16 “problem areas.” Times range from 20-29 hours in Myrtle Beach, SC, and Long Island, NY, to 50-60 hours in Ft. Myers, FL, and New Orleans, LA.

Keywords:
coastal areas, development, disaster planning, environmental protection, erosion, Florida

Abstract: Sanibel Island, FL, is relatively undeveloped, as a wildlife preserve comprises about two thirds of the land mass. The causeway that connects the island with the mainland threatened the island with over-development, and the city voted to adopt a growth cap restricting the number of new housing units. In part, it was unsafe to have more people on the island than could be evacuated in an emergency. The city’s image became synonymous with smart growth, a stringent building code, stringent zoning laws, conservation, and preservation. The city purchased land prone to erosion and replaced sand only after much debate. Residents want to save the coastal environment and see a problem with people who build too close to the beach.

Keywords:
Australia, awareness, risk communication

Abstract: Flood warnings often don’t work well and too frequently fail completely – and this despite great effort by the responsible authorities. The reasons for this may be inherent in the methodology and definitions used to assess warnings, for example, higher standards may be applied to warnings than to other forms of risk communication, and the definition of failure will often determine the outcome of an evaluation. Aside from these methodological issues, warnings may fail for a range of reasons associated with the meshing of the warning message with those at risk; as well as institutional factors such as cooperation between the organizations involved, and how they conceptualize the warning task. The task may be conceptualized narrowly leaving out important elements of the risk. These factors are examined in the context of recent European and Australian research and experience of warnings. Despair is understandable; while resources devoted to warning systems are fairly static, the task is probably becoming more challenging by the day because of social evolution – and in turn this raises the issue of the validity of much earlier research. Although success with warnings may become more difficult to achieve, there are potential changes in the operating environment that may force higher performance. Other conclusions include: the importance of developing consensus over the aim of warning systems; a more negotiated approach to those at risk (rather than a monopolistic supplier approach); and targeting to ensure that no identifiable group is missed.

**Keywords:**
communication, Europe, risk communication

**Abstract:** The paper examines recent reviews of flood warning systems in North America and Europe and identifies areas and issues not covered by the reviews. The author criticizes the flood warning systems for insufficiently recognizing that communities, businesses, and individuals must possess the initiative to reduce flood risk and property loss. The needs of those at risk should be the central consideration of flood warning systems. The author feels that floodplain management professionals are overly confident in the transferability of flood warning systems between and within countries. US flood warning systems are often used as models for Australian towns, and research conducted in rural towns is routinely applied to metropolitan areas without consideration of differences. The study identified common themes in the materials. First, flood warnings are an important part of flood risk management but are no substitute for effective risk management. Second, concerns over enforcement raise questions regarding the sole reliance on a regulatory approach for floodplain management. Reviews of warning systems generally emphasize the potential of modern technology in monitoring, modeling, and predicting floods. However, because local warning and response is the basis for effective flood warning management, the potential of these large-scale applications may be less than anticipated. Moreover, the main problems with existing flood warning systems relate to human and institutional failure and it is not clear how advanced technologies would remedy them. Similarly, nearly all post flood-disaster reports advocate pre-event public awareness and education. However, there is no conclusive evidence that public education makes a significant difference to human response to warnings. Without clear approaches to assessing success or failure, floodplain management professionals cannot be confident in the effectiveness of warning systems.

**Keywords:**
disaster assistance, insurance industry, risk management, subsidies

**Abstract:** The author explores the conventional view of disaster policy, which suggests that government programs reduce dependence on “free” disaster assistance and promote efficient risk management by property owners and farmers. He draws three conclusions from his analysis. First, the narrow scope of private-sector disaster insurance reflects in large part the low demand for coverage. Demand is low in part due to the availability of disaster assistance, which substitutes for insurance. Federal tax policy reduces supply by substantially increasing insurers’ costs of holding capital to cover large but infrequent losses. Second, government insurance programs fail to encourage efficient risk management because of subsidized rates and limited underwriting and risk classification. Third, the practice of subsidizing government insurance, while giving disaster assistance to people who eschew coverage and to some people who have it, is more likely to raise taxpayers’ costs than to reduce them.

Keywords:
NFIP, repetitive losses
Abstract: The article addresses the current state of the NFIP in light of rising disaster cost and insurance payments. FEMA and others have identified repetitive loss properties as a significant factor in escalating disaster costs. The author gives the example of a property in Canton, MS, valued at $49,300, which had experienced 25 losses in an 18-year period and received over $160,000 in claims. FEMA estimates that the number of new repetitive loss properties increases by an average of more than 1,500 per year. Flood insurance fraud and the false sense of security created by structural improvement projects are among the other problems cited by the author. The driving force behind all these issues is an inherent desire among homeowners to live near water.

Available at: http://www.fema.gov/pdf/nfip/rate_rev03.pdf
Keywords:
insurance premiums, insurance rates, NFIP
Abstract: This report is part of an annual review of the NFIP underwriting experience. The annual review indicates the results of the most recent actuarial review of the NFIP’s rating structure. The report begins by analyzing aspects of the NFIP, including its financial structure, ratemaking considerations, and overall rate level indications. Based on cost projections, expected average written premiums, and the relationship of the written premium to past flood insurance premiums, the rate review determined that the premium for the upcoming year is 124 percent of the level needed to fund the historical average loss year. The premium represents an overall increase of 2.2 percent.

Available at: http://www.fema.gov/pdf/nfip/rate_rev01.pdf
Keywords:
insurance premiums, subsidies
Abstract: This document presents the results of the annual actuarial review, undertaken to maintain the NFIP’s goal of fiscally sound rating and coverage structure. The distribution of business written in 2002 is anticipated to be 29 percent at subsidized rates and 71 percent at full-risk premiums. The most recent changes went into effect on May 1, 2001, with an average rate increase of 3.2 percent for actuarially rated policies and 2.7 percent for subsidized policies or an average increase of 3.0 percent across the program. The premium based on all rate and rule changes through May 2002 is expected to be 122 percent of the level needed to fund the historical average loss year. Finally, this year’s review recommends that the actuarial based rates increase 2.9 percent and the subsidized rates increase 2.3 percent.

Abstract: This document presents the results of an annual actuarial review, undertaken to maintain the NFIP’s goal of fiscally sound rating and coverage structure. The distribution of business written in 2003 is anticipated to be 28 percent at subsidized rates and 72 percent at full-risk premiums. The most recent changes went into effect on May 1, 2002, with an average rate increase of 2.9 percent for actuarially rated policies and 2.3 percent for subsidized policies or an average increase of 2.6 percent across the program. The premium based on all rate and rule changes through May 2003 is expected to be 120 percent of the level needed to fund the historical average loss year. Finally, this year’s review recommends that the program eliminate the Expense Constant, a flat fee paid by policyholders to cover certain acquisitions costs and general expenses, in a revenue-neutral manner.

Abstract: Since 1990, CRS has provided flood insurance premium discounts in recognition of local floodplain management programs that exceed the minimum requirements of the NFIP. The amount of the discount depends on the number and importance of activities a community implements and the sum of the individual scores for each activity. This handbook discusses the process of evaluating the effectiveness of CRS activities based on actual performance during flood events. The recommended evaluation process covers both those items needed to measure effectiveness in CRS terms and those non-NFIP or non-CRS benefits that floodplain management activities provide to a community.

Abstract: For many in eastern North Carolina the combined effects of Hurricanes Bertha and Fran in 1996 set a new benchmark from which to measure future storms. FEMA commissioned this report in order to assess the benefits provided by selected mitigation activities implemented by communities and by CRS. The project aimed to put a dollar figure on the actual flood damage prevented by the mitigation activities in a real event, not theoretical calculations of benefits and costs. The project team reviewed nine CRS mitigation activities and elements in eleven communities that were hit by Hurricane Fran: six coastal and five inland. The team collected flood data and interviewed local officials. It estimated damage data and compared the data with available disaster assistance and claims payments from flood insurance. One conclusion (among several others) indicates that structures built with no flood protection standards suffered twice the damage as those built to NFIP standards, and four times the damage to those built to the newer state coastal construction standards.

Keywords: Community Rating System, Hurricane Floyd, mitigation, North Carolina

Abstract: This report reviews the performance of several communities’ activities as part of CRS during and after Hurricane Floyd in North Carolina in 1999. Using a combination of data collected in the field, data from flood insurance claims, and interviews with local officials and residents, this report evaluates the impact of several CRS activities and elements (e.g., public information activities, mapping and regulations, and flood damage reduction). The report finds that although residents of communities participating in CRS have a higher level of awareness of their exposure to a flood hazard, retain a higher level of flood insurance coverage, and implement more flood protection measures, these indicators cannot be statistically linked to public information programs undertaken at the local level. Also, the report estimates that the average savings from preserving flood-prone areas as open space ranged from $47,500 to $111,000 per acre. The report also finds that the acquisition and relocation of flood-prone buildings was more effective at reducing flood losses than any other approach and that CRS was the cause for starting or modifying some local activities. However, in many cases CRS was not the only cause and it was overshadowed by recent flooding and disaster assistance funds. Further, the report finds that CRS had a greater impact on activities that were inexpensive or could be implemented with current staff resources (e.g., public information and flood warning).

Keywords: Hurricane Floyd, insurance industry

Abstract: Insurers may have fared relatively well in the wake of Hurricane Floyd, which swept along the eastern seaboard of the United States in September 1999, wreaking havoc in many states. Property damage caused by flooding is expected to reach $2.5 billion but insured damages may only be in the area of $0.5 billion as most policies exclude flood damage, according to the Insurance Information Institute. A large part of insurers’ liability will be for damages to vehicles covered by comprehensive policies. Allstate and Nationwide said they had each received around 10,000 claims. State Farm said it had received over 26,000 but expected this number to rise as flood waters subside. This latest catastrophe has thrown the viability of the catastrophe bond market, used by some insurers as an alternative to reinsurance, into stark relief.

Keywords: coastal areas, erosion, insurance premiums

Abstract: This study concludes that, despite facing higher risk, homeowners in erosion-prone areas currently are paying the same amount for flood insurance as are policyholders in nonerosion areas. The study suggests that FEMA incorporate the risk of erosion into the cost of insurance along the coasts. Otherwise, other NFIP policyholders will have to subsidize what is likely to become a substantial cost.

**Keywords:**
coastal areas, mitigation, risk assessment

**Abstract:** This book addresses the need for a broader understanding of the categories and extent of the costs of coastal hazards. It makes specific recommendations for the improvement of the estimation and reporting of the cost of coastal hazards, for the improvement of risk and vulnerability assessment, and for the development and evaluation of mitigation strategies. The recommendations for improvement in these areas demand efforts at the federal, state, and local levels, and they focus on expanding the conceptual framework—previously limited to economic considerations—to include social, business, and environmental costs. In addition to these recommendations, the report proposes a framework for community planning. This framework is organized around three principles: (a) the importance of developing a broad set of alternative mitigation and preparedness strategies, recognizing the relevance of the status quo but not being restricted by current policy; (b) the importance of characterizing the potential losses from disasters of different magnitudes by linking risk assessment with a region’s vulnerability; and (c) the need to incorporate a broad range of economic, business, social, and environmental costs (both immediate and over time) associated with weather-related hazard events when evaluating alternative mitigation and preparedness strategies.

**Keywords:**
coastal areas, erosion

**Abstract:** Erosion presents a significant hazard to waterfront houses, businesses and public facilities and over the next 60 years, erosion may claim one in four houses within 500 feet of the US shoreline. The NFIP does not map erosion hazard areas to inform homeowners of the risk they face, nor does it directly incorporate erosion risks into insurance rating procedures. The report suggests remedying both these deficiencies. To support this recommendation, the report analyzes policy options and evaluates the effectiveness of each in reducing erosion losses. Using detailed field measurements and mail survey information, data was collected for 11,000 buildings located within 500 feet of the shoreline in 18 counties. The findings of this report are that property owners face as large a risk of damage from erosion as they do from coastal flooding, that roughly 1,500 homes will be lost to erosion each year on average, at a cost to coastal property owners of $530 million per year. Additionally, most of the damage from erosion will occur in low-lying areas also subject to the highest risk of flooding. With respect to the NFIP, most erosion-related losses sustained by policyholders are reimbursed by the program, though erosion damage is not reflected in flood insurance rates. The report finds that to fully reflect risk, insurance rates in the highest risk coastal areas must be twice current rates on average. The cost of identifying, mapping, and disseminating information on erosion hazards...
nationwide is about $5 million per year, what the report considers to be a worthwhile investment. The report recommends FEMA develop erosion hazards maps that display the location and extent of coastal areas subject to erosion and that FEMA include the cost of expected erosion losses when setting flood insurance rates in coastal areas.

Keywords: flood damage

Abstract: The chapter addresses the composition and size of flood losses in the context of increasing losses despite structural mitigation by the federal and state governments. The author distinguishes between rare catastrophic flood losses and total flood losses between 1903 and 1958. Catastrophic floods are defined as those at or above the 1 percent annual chance standard. The study finds that flood damages in the United States have averaged approximately $200 million annually, but with significant fluctuation. Between 1903 and 1955, more than 50 percent of the years had damages—including catastrophic and noncatastrophic damages—under $100 million and only two years had damages over $1 billion. Noncatastrophic flood losses ranged from $1.5 million to over $350 million. The variability of catastrophic flood losses was much greater: as high as $954 million. Sixty percent of the years examined did not experience a catastrophic flood. The research also finds that there has been a noticeable increase over the years in total flood losses and catastrophic floods accounted for a larger share of total floods over time.

Keywords: building codes, development, economic modeling, floodplain management, property values, zoning

Abstract: This paper considers the effect of floodplain management programs on the market for vacant residential land. The authors model the developers’ profits from housing production to illustrate the expected effects of parcel characteristics on land value. The hedonic method is utilized to analyze data on vacant floodplain parcels from nine communities that vary by type of flooding, regulatory programs, and geographic location. The authors’ results show that zoning floodplains for lower density development, implementing building regulations requiring elevation above the level of the flood, and providing clear local leadership of programs each contribute to the lowering of land values in the floodplain.

Keywords: Base Flood Elevation, floodplain management, mitigation

Abstract: The NFIP emphasizes building elevation requirements to protect property from flood damage and to limit continued increases in flood losses. Economists believe that the cost to elevate buildings will shift some development to locations not prone to flooding. This article
provides evidence that elevating buildings to NFIP standards does indeed reduce losses, but that adding additional elevation requirements will have little effect on the rate of increase in floodplain development. Instead, these requirements must be supplemented by regulating the use of land within floodplains.

**Keywords:** enforcement, legal issues and litigation, liability, Louisiana, NFIP

**Abstract:** This article discusses the evolution and operation of the NFIP and Louisiana’s stake in the program’s success. Louisiana is a major participant in the NFIP, representing almost 12 percent of all policies in 260 participating communities. Research on the execution of the program in a number of specific inland and coastal Louisiana regions and communities illustrates both successes and problems in its implementation. The author notes that federal disaster relief payments might be lower if participation in the NFIP were required in high-risk areas. The article also considers the emerging problem of enforcement and the extent to which floodplain ordinances give rise to duties and liabilities. In *United States v. Parish of St. Bernard*, the United States sued for violations of obligations and ordinances under the NFIP. The impact of this case will determine whether litigation could become an enforcement tool. The article also examines the question of what the federal government can do to recover its losses. Recommendations for making the NFIP economically and politically viable include actions at the congressional level, such as structuring water project construction and disaster relief to aid rather than frustrate the NFIP; examining other federal assistance and disaster relief benefits to flood-prone areas; and mandating a study of the degree to which upstream levees and channelization affect water downstream. Other recommendations involve improvements available to FEMA and local authorities within the NFIP, suggestions for structural elevation and storm-proofing requirements for insurance eligibility, and suggestions for strengthening FEMA’s resources.

**Keywords:** coastal areas, development, media, repetitive losses, subsidies

**Abstract:** The article addressed the common misconception that all coastal residents have, or are eligible for, subsidized flood insurance from the NFIP, at considerable cost to taxpayers. In reality, a small percentage of NFIP policies are in floodprone coastal areas and these areas have paid more in premiums than they have received in flood claims. Between 1978 and 1995, actuarially based NFIP policies in SFHAs have generated a $169 million surplus after claims and expenses were paid. Furthermore, NFIP officials state that policyholders are charged actuarially sound insurance rates that fully reflect the building’s risk of flooding. The percentage of subsidized policies is declining over time as well. The article blames the persistence of myths regarding flood insurance on media reporting that highlights structures that have been repeatedly flooded and received claims payments. While repetitive loss properties are a serious problem and one the NFIP is actively addressing, they comprise a small portion of the total program. Disproportionate media coverage creates the impression that all NFIP policies are heavily subsidized. The article concludes that the NFIP has been successful, despite bad press coverage.

**Keywords:**
disaster planning, mapping, mitigation, Project Impact

**Abstract:** As a result of FEMA’s response to the many natural disasters of the 1990s, Congress directed FEMA to make mitigation of impacts from future natural hazards its highest priority in working with state and local governments. The NFIP, and its related flood-risk studies and flood hazard mapping activities, are increasingly important functions to support mitigation. Current initiatives include modernizing flood hazard maps, lowering the cost of producing maps, and increasing the accuracy of mapping products. Emphasis of support to local areas is demonstrated by Project Impact, which seeks to mitigate disasters’ impacts by taking preventive actions.

**Keywords:**
lending institutions, mandatory purchase

**Abstract:** The Federal Insurance Administrator explains that mandatory purchase provisions of the National Flood Insurance Reform Act (NFIRA) of 1994 require owners of all structures located in SFHAs of communities participating in the NFIP to purchase and maintain flood insurance as a condition of receiving a federally related mortgage or home equity loan on that structure. Although policyholder growth has increased markedly since the effective date of the joint final rule, a considerable gap remains between the number of households that the program insures in hazard areas and the number at risk. By following the correct procedures to determine whether the structure to be refinanced is in a SFHA as shown on a FIRM, lenders will comply with the law. The basic approach to complying with flood insurance requirements for all mortgage-related personnel in any lending institution has four steps. First, understand the flood peril. It can and does flood throughout the United States and its territories, especially in SFHAs but also in non-hazard areas. Many lending institutions have outsourced the responsibility of performing flood zone determinations to a flood zone determination company. Second, know all the compliance issues. The Act and its accompanying regulations cite compliance provisions in the areas of coverage, escrow, force placement, determination fees, use and retention of required forms, dispute resolution, and proper notification procedures. Third, focus on retention. Have a process in place to monitor renewals; keep service information up-to-date on all policies so that expiration notices get to the proper entities; develop a diary system to verify that each policy does renew. Fourth, be a risk manager. Manage flood insurance issues beyond their compliance minimums and treat it similarly to all other risk-related issues in the loan process.

**Keywords:**
insurance, NFIP, United Kingdom
Abstract: The floods of summer 2002 in Central Europe and China, along with various other natural disasters in recent years, illustrate the need for an insurance system that can adapt to new situations triggered by phenomena such as climate change. This paper analyzes whether a private insurance scheme could handle post-flood recovery more efficiently and equitably than a government-sponsored insurance scheme. The author focuses on the United Kingdom’s flood insurance scheme, which is one of the few systems where private insurance has traditionally been the primary tool for insuring against flood damage. The report addresses the quality of flood insurance and the processes for establishing the insurability of flood events in England.

Keywords:
coastal areas, floodplain management, mitigation, 1 percent annual chance flood standard, sea-level rise

Abstract: Congress created the NFIP to provide much-needed flood insurance to property owners and to decrease the nation’s susceptibility to flooding. Relative sea-level rise now poses a threat to the nation’s flood preparedness, with coastal property owners facing increasingly severe flooding. FEMA could address this vulnerability in several ways. By recalculating and extending the 1 percent annual chance floodplains to incorporate estimates of relative sea-level rise, the program would prepare coastal property owners for the near-future flood risks. Further adaptation approaches to improve the NFIP include requiring floodproofing, obtaining “rolling easements,” and conducting education campaigns.

Keywords:
coastal areas, development, North Carolina

Abstract: In her capacity as legislative officer for the Association of State Floodplain Managers, Inc. and the Maryland Department of Natural Resources, Water Resources Administration, Hughes takes exception with the assumption that the NFIP represents a major factor in coastal development. She notes that much of the development occurred before the NFIP was established. Indeed, state coastal zone managers told the Congressional Research Service in 1988 that they could not document how the NFIP affects patterns of coastal development and the value of coastal property. She cites the example of Topsail Beach, NC, where privately funded infrastructure has led to development.

Keywords:
floodplain management, strategic planning
Abstract: The coordinator of the Coalition to Restore Aquatic Ecosystems (CRAE) highlights four findings from *Sharing the Challenge* with respect to floodplain management: (a) integration of multiple objectives; (b) interagency coordination; (c) local control; and (d) coordination mechanisms. Within CRAE, there exists general consensus that strategies to reduce flood damage should be integrated with strategies for achieving other objectives. Communities should take the lead in the development and implementation of these strategies for their subbasins while considering information on the relationship between their subbasins and the rest of the watershed. State and federal agencies should work at a regional level to develop the larger watershed context in which these strategies will operate, and provide data and technical and financial support to these local efforts. This well-integrated framework for making decisions on water resource management can realize economic and environmental objectives on a sustainable basis and cut the costs of flood control.

Keywords: awareness, insurance purchase decision, North Dakota, Red River, risk communication, risk perception

Abstract: In 1997, devastating floods along the Red River of the North in North Dakota affected over 90 percent of the 50,000 residents in Grand Forks. Only 20 percent of damaged homes were covered by flood insurance, leaving taxpayers and victims to shoulder most of the costs of recovery. In an effort to improve awareness of the need for disaster protection, the “Grand Forks Flood Insurance Summit” was held, bringing together federal, state, and local government officials with the insurance industry. In preparation for the summit, IBHS and the University of North Dakota’s Bureau of Governmental Affairs conducted a survey of Grand Forks homeowners to determine which factors influenced their decision to purchase or not purchase flood insurance. Results indicate that most homeowners simply believed they were not at risk from flooding. This report also describes actions taken since the flood and provides recommendations to the insurance industry and government to improve flood awareness and the purchase and retention of flood insurance.

Keywords: attitudes, building codes, hurricanes, insurance industry, mitigation

Abstract: This report describes the results of a study designed to obtain information from Atlantic and Gulf coastal residents concerning their opinions about various issues related to building codes in geographic areas subject to damage from hurricanes and other strong storms. During July 1994, telephone interviews were completed with residents located in six coastal areas—Corpus Christi, TX; Biloxi, MS; Myrtle Beach, SC; and Tampa, Miami, and Jacksonville, FL. The final number of completed interviews totaled 1,241. More than nine out of every 10 respondents (93 percent) indicated that they felt it was very important that homebuilders in their locale be required to follow building codes. Over one-third of residents (37 percent) indicated
that they had made improvements to their residences in order to reduce the amount of damage that might occur as a result of another hurricane; 62 percent said they had not. Most respondents (85 percent) indicated that it was very important that local building departments conduct inspections of new residential construction. Finally, seven out of every 10 residents (71 percent) indicated that they felt insurance companies should have a role in trying to reduce hurricane-related property losses; 22 percent felt they should not. The responses given most often as to what insurers should do included: inspect buildings to ensure that they meet existing codes before insuring, offer rebates or discounts for homes that meet the codes, work with buildings to ensure homes are built to code, and lobby for stricter building codes.

*Keywords*: NFIP, public policy

*Abstract*: This comprehensive guide provides information to state legislators and staff on the NFIP and ways in which state legislators can improve awareness of flood risks and flood insurance protection, promote sound floodplain management, and assist victims of flooding disasters. Chapter topics in the guide range from the availability of flood insurance to the role of states in the NFIP to the mapping of floodplains. Appendices provide statistics on the NFIP, samples of flood insurance-related communications from states, and key contacts.

*Keywords*: economic modeling, hurricanes, liability

*Abstract*: This study starts with two hypothetical hurricanes causing $7 billion each in insured property losses and tracks those losses through the insurance system to find out where they would fall. It also analyzes the financial impact two such losses would have on primary companies and reinsurers, as a group, in the United States and abroad. The study collected information on actual hurricane losses for 1983 and 1985, resulting in a substantial upward revision of earlier loss estimates for those storms.

*Keywords*: insurance agents, insurance industry, insurance purchase decision, mandatory purchase, marketing, Write Your Own Program

*Abstract*: The Insurance Research Council (IRC) conducted a series of surveys to review the organization, operation, challenges, and achievements of the NFIP and WYO from the perspectives of insurance companies and insurance agents in 1989. One of the purposes of this research was to examine whether WYO and the NFIP are structured to maintain and increase the involvement of insurers and agents in selling flood insurance. Of equal concern was the issue of whether the flood programs are designed to attract and enable property owners who need flood
coverage to buy it. A total of 104 insurers responded to surveys on WYO and the NFIP. Participating insurers represented 63 percent of 1988 total industry volume for property insurance premium. Four hundred and seventy-eight insurance agencies doing business in the 11 largest states for flood insurance policies completed the flood insurance surveys. A major finding from the surveys revealed agreement among insurers, agents, government officials, environmental, floodplain, and land-use organizations that mortgage lenders hold one of the keys to better compliance with the requirement for mandatory purchase of flood insurance. The surveys also found that 88 percent of both agents and insurers expressed some agreement with the statement that a more extensive public campaign to raise awareness about flood hazards and the availability of insurance would be effective in increasing the number of policies. The report provides discussion on additional findings from the surveys.

**Keywords**: coastal areas, compliance, building codes, enforcement, Hurricane Andrew, insurance claims, insurance coverage, insurance industry, mitigation

**Abstract**: This report by the Insurance Institute for Property Loss Reduction (IIPLR) and the Insurance Research Council (IRC) examines problems raised by destructive hurricanes with respect to the growing concentrations of people and property in high-risk coastal areas. It also discusses the urgent need to provide better protection for people, buildings, and communities through more rigorous construction standards and better enforcement of building codes, flood insurance requirements, and land-use regulation in areas subject to hurricanes. The study provides current data on insured coastal exposures and coastal populations in the United States by state and county. It also includes estimates of potential losses from severe hurricanes at vulnerable points along the Gulf and Atlantic Coasts, underscoring the magnitude and rapid growth of coastal exposures. For example, Hurricane Andrew caused $15.5 billion in insured losses, exceeding previous understanding about the maximum damage a single hurricane could cause. Finally, the report discusses steps that coastal areas at risk can take to lessen the damage and prepare for the next catastrophic event. Market forces, consumer tastes, training and education in the construction industry, and the insurance industry could all serve to encourage coastal communities to improve and enforce building regulations.

**Keywords**: attitudes, building codes, disaster assistance, disaster planning, insurance coverage, natural disasters, risk perception

**Abstract**: This first issue of the Insurance Research Council’s (IRC) *Public Attitude Monitor 1999* (PAM) report examines public attitudes toward coping with the property damage caused by natural disasters. Recent disasters have caused unprecedented levels of property damages and insurance claims payments. Disasters events such Hurricane Andrew in 1992 and the Northridge earthquake in 1994 have served to increase public awareness of the threats posed by natural disasters. According to a survey by IRC, six in 10 Americans believe that a natural disaster will occur in their community in the next 10 years. Most homeowners (88 percent) said they have
purchased a standard homeowners insurance policy to address the risk of loss from natural disasters, but few have purchased any supplementary coverage. For example, only 6 percent of homeowners said they have purchased a government-subsidized insurance policy such as flood insurance. More than a quarter of all respondents said they are primarily relying on disaster relief to help them recover from a natural disaster. Although the public strongly supports the federal disaster relief programs, seven of 10 would prefer that homeowners in areas with a high risk of natural disasters be required to purchase private insurance. Finally, eight of 10 respondents supported requiring new homes to be built to withstand damage in the event of a natural disaster. Nearly seven in 10 said they would willingly spend 6 percent or more on a new home built to withstand a natural disaster. The survey consisted of face-to-face interviews with 1,972 men and women 18 years of age and over.

Keywords: attitudes, building codes, flood disaster planning, insurance coverage, natural disasters, risk perception

Abstract: According to a survey by the Insurance Research Council (IRC), 72 percent of homeowners believe that state and local requirements that new homes be built to withstand damage from natural disasters are an excellent or a good idea. Sixty-two percent say they would be very or somewhat willing to pay an additional 6 percent for a new home to meet the requirements. The report shows that support for building codes transcends geographic regions but is especially strong in the South, which historically has been vulnerable to hurricane damage. Among homeowners in the South, four of five people say that building codes are an excellent or a good idea, and over 68 percent maintain their support even when the codes add 6 percent to a new home’s cost. Even when not legally required, many homeowners have taken steps to protect their home from common household perils such as flooding caused by rain or snow (64 percent). For every peril, the percentage of homeowners who have taken steps to protect their home increases with household income. The survey also found that 95 percent of homeowners carry a homeowners or condominium owners’ insurance policy. Approximately 22 percent have purchased additional water back-up and flood coverage (20 percent). Homeowners who believe that a natural disaster will damage homes in their area are more likely than homeowners who do not believe they are in a disaster-prone area to purchase coverage for floods (31 percent). The survey consisted of telephone interviews with 1,000 male and female adults 18 years or age or older. The sample was screened to include homeowners only, and participants were selected to be representative of the population of the continental United States.

Keywords: floodplain management, Midwest floods of 1993, mitigation, public policy

Abstract: In January 1994 the Clinton Administration’s Floodplain Management Task Force assigned the Interagency Floodplain Management Review Committee (the Committee). Its mission was to delineate the major causes and consequences of the Midwest floods of 1993 and
to evaluate the performance of existing floodplain management and related watershed management programs. The Committee was also asked to make recommendations to the Task Force on changes in current policies, programs, and activities of the federal government that most effectively would achieve risk reduction, economic efficiency, and environmental enhancement in the floodplain and related watersheds. This is the final report of the Committee. The thesis of the report is straightforward: floods will continue to occur. The goals for floodplain management are clear. The means to carry out effective floodplain management exist today but need improvement and refocusing. The report concludes that the United States has lacked the focus and the incentive to engage itself seriously in floodplain management. The 1993 flood managed to focus attention on the floodplain and provided the incentive for action. The Committee proposes “a better way” to manage the floodplains. It begins by recognizing that all levels of government, all businesses, and all citizens have a stake in properly managing the floodplain. The Committee supports a floodplain management strategy of avoiding inappropriate use of the floodplain, minimizing vulnerability to damage through both structural and nonstructural means, and mitigating flood damages when they do occur. To ensure a long-term, nationwide approach to floodplain management, the Committee proposes legislation to develop and fund a national program to manage floodplains with principal responsibility and accountability at the state level. It also proposes revitalization of the Water Resources Council to better coordinate federal activities, limited restoration of some basin commissions for basin-wide planning, and issuance of a presidential executive order requiring federal agencies to follow floodplain management principles in the execution of their programs.

Keywords: floodplain management, mitigation, public policy, Red River

Abstract: After the Red River Basin flood of 1997, the governments of the United States and Canada asked the International Joint Commission (IJC) to analyze the root causes of the flood and to make recommendations as to how damage from major Red River floods could be mitigated in the future. This final report endorses most of the International Red River Basin Task Force’s conclusions and recommendations, modifies some, and adds some new conclusions and recommendations of its own. For example, the IJC makes the following recommendation: to reduce vulnerability to flooding, all possible approaches, including both structural and nonstructural damage reduction measures, must be considered as part of a comprehensive plan. This would include, when environmentally, economically, and socially justified, development of additional reservoir storage, restoration of wetlands, microstorage, construction or improvement of levees and dikes, floodwalls and bypass channels, permanent evacuation of high-risk areas, flood-proofing, and the enhancement of flood forecasting and warning systems.

Keywords: floodplain management, mitigation, public policy, Red River

Abstract: The International Joint Commission asked the International Red River Basin Task Force to investigate the causes and effects of the disastrous Red River Basin flooding of 1997
and to recommend ways to reduce the impact of major floods. This report summarizes the proposals of the Task Force, which range from stricter building standards in SFHAs to improved interagency coordination of flood management responsibilities. The following recommendations provide a sample of those presented: (Recommendation 3) communities in the United States portion of the Red River Basin should ensure that community-built flood damage reduction projects are certified by FEMA for 1 percent annual chance or greater protection, or should participate in the Non-Federal Flood Control Works Inspection Program; (Recommendation 15) the 500-year flood (0.2 percent flood) should be defined throughout the Red River Basin and used to inform the public of the potential risks of flooding from rare events, including the need to buy flood insurance in the United States, and as the basis of regulations for siting and floodproofing critical facilities; and (Recommendation 19) state, provincial, and other appropriate authorities should review the effectiveness of and compliance with the floodplain management regulations in the Basin and take steps as needed to improve enforcement. Many of the topics addressed by this report parallel those addressed by the evaluation of the NFIP.

NOTE: This study represents the first part of an effort by FIA to reexamine its policies and procedures on substantial damage. The second part of the effort, a workshop held in Ocean City, MD, also appears in the bibliography.

Keywords: Community Rating System, substantial damage, compliance, permits, mitigation

Abstract: In order to measure the extent of compliance with the substantial damage provision, FIA asked ISO Commercial Risk Services, Inc., to review the disposition of a sample of buildings that, based on insurance claims, had incurred substantial damage. The sample consisted of 189 buildings in 15 communities and seven states. Damage to the buildings resulted from local drainage problems, high and low velocity overbank flooding, and coastal storms. The NFIP Bureau and Statistical Agent provided data on insurance claims and ISO contacted officials in the 15 communities to collect permits and to determine the disposition of the buildings. Based on a preliminary review of the data collected, ISO drew a number of conclusions. Due to various errors, ISO could obtain usable data for only 137 of the 189 buildings in the sample. Of these 137 buildings, 23 percent had been removed, vacated, or replaced with compliant structures; 45 percent had building permits showing no substantial damage; and 32 percent had no building permits. An average of 11 percent of the damage cost reported on flood insurance claims was attributed to items not related to structural damages incurred by the main building on the property. Finally, numerous items reported on claims forms do not appear on permits. Permit records show only 41 percent of the total structural damages that claims records show.

NOTE: This workshop represents the second part of an effort by FIA to reexamine its policies and procedures on substantial damage. The first part of the effort, a study on substantially damaged structures, also appears in the bibliography.

Keywords:
floodplain management, insurance coverage, mitigation, substantial damage, substantial improvement

Abstract: FEMA convened a workshop to review the extent to which substantially damaged buildings were not brought-up to post-FIRM standards or re-rated as post-FIRM buildings and to recommend changes to NFIP policies and procedures. The NFIP is faced with a large percentage of substantially damaged buildings that are neither rebuilt to post-FIRM standards nor re-rated as post-FIRM buildings. Furthermore, different actors use different methods to determine substantial damage. An actor can manipulate damage costs and building values to achieve a desired outcome. Based on these and similar conclusions, participants recommended several potential solutions. For example, participants would support intensive assistance and additional staff to permit officials following a flood. Participants would also support a simplification of the definition of substantial damage to make it more consistent with current practices.

Keywords: mapping, modeling, risk assessment

Abstract: Quantitative, probabilistic hazard assessment is generally based on the record of past hazardous events and used to account for present and near future hazards. However, the catalog of hazardous events is not always the only input to the assessment. Sometimes, generalized models, based on the historic record that account for the physical processes in the region, are used. To be maximally effective, the latest scientific knowledge must be applied when estimating future hazards and risks. Take, for instance, NFIP maps. For most localities, flood zones were mapped many decades ago. Land use patterns have since drastically changed in many of the most rapidly developing regions of the United States, altering the ability of the land to absorb high amounts of precipitation and to extend the duration of runoff in rivers and floodplains. Flooding beyond designated flood zones appears to be increasing, although systematic surveys to confirm this notion are generally lacking. Hence, flood-zone mapping does not depict the present state of the hazard, nor has the evaluation of other increasing risk exposures threatening many parts of the United States occurred.

Keywords: dams, development, flood control, modeling, nonstructural approaches, Texas, structural approaches

Abstract: This article asks the reader if building flood control dams and other structures are the best way to reduce flood damages. Structural measures like large dams provide a false sense of security that makes people feel they are safe from flooding. Structural measures are also expensive and can result in catastrophic losses if they fail. By contrast, nonstructural alternatives include managing existing dams to mitigate floods during emergencies, preventing construction in low-lying areas, lessening the impacts of urbanization, and increasing the effectiveness of flood insurance and floodplain management. The author summarizes efforts to alleviate flood
risks posed by the upper Trinity River in North Central Texas. Studies are underway to assess the impact of floods based on the amount of development allowed in low-lying areas. Local officials are regulating development in the region’s floodplains by establishing uniform criteria. The U.S. Geological Survey is working with state agencies to improve models to simulate flows in the Trinity River basin and to identify high-risk areas. Further south, Harris County has started to build computer models to provide a better idea of how many homes and businesses have been built in low-lying areas.

Abstract: FEMA is working to refine its assistance to engineers and floodplain managers by issuing revised and simplified guidance and modeling to mapping regulated floodplains subject to alluvial fan flooding. FEMA has also developed and released a model to be used on a personal computer that is intended to simplify the application of FEMA’s alluvial fan flooding methodology. The timeliness and accuracy of mapping or remapping the flood risk for alluvial fan flooding sources shown as SFHAs on FIRMs have improved and will continue to improve. FEMA has taken steps in Fiscal Year 1990 to improve the quality of the draft flood insurance studies by revising the study guidelines and by releasing a PC version of the alluvial fan model. In Fiscal Year 1991, FEMA plans to work to revise the guidance and regulations to define more clearly the documentation that would demonstrate that the protection provided by natural or structural flood-control measures warrants removing areas from SFHAs with alluvial fans.

Abstract: The National Association of Realtors cited this study during a hearing held by the Senate Committee on Environmental and Public Works on S. 2729, which proposed amendments to the Coastal Barrier Resources Act (CBRA) of 1982. A copy of the paper is no longer available; therefore, the summary provided here represents the assessment of the realtors and should be viewed in that light. This paper assesses development on coastal barriers between 1982 and 1988. Jones and Stolzenburg examined aerial photographs of coastal barriers concluding that the number of structures in these areas increased 40.7 percent. Half of the development occurred in Florida. Although one of the purposes of CBRA was to discourage development by denying the availability of flood insurance and federal financial assistance, the study finds that the prohibition of flood insurance in these areas did not preclude development.

Abstract: This article examines the influence of floodplain land-use policy on land market decisions of three private-sector decision makers: owners of vacant land, developers, and building owners. It is based on a mail survey of 312 such decision makers in 10 cities across the United States. The findings imply that effective floodplain programs must target builders and developers and owners of vacant land because their decisions come earlier in the rural-to-urban land conversion process and they are more likely to avoid the hazard or take mitigation actions in response to information, incentives, and regulations. Nevertheless, policy should also target the consumer, emphasizing insurance and awareness of the risks of flood damage, something that current policy does not do adequately.

Keywords: economic modeling, insurance purchase decision

Abstract: Computer simulation experiments were conducted to determine the effects of alternative sources of uncertainty on the willingness to pay for flood insurance. Two alternative insurance protection schemes were investigated: coinsurance and fixed coverage. The question investigated here is to what extent the insurance scheme influences how purchasers respond to flood risks. Floods were assumed to be the log of a normal distribution and the effects of uncertainties in the parameters of this distribution on the purchase of insurance were explored using response surface analysis. Results indicate that fixed coverage insurance provisions shift most of the uncertainty in the physical parameters governing natural disaster occurrences away from the insured and onto the insurer. The results also show that the form of the damage function has little effect on the demand for flood insurance.

Keywords: dams, hydrology and hydraulics, modeling, risk assessment

Abstract: The safety of many existing dams could be improved by modifying them structurally in accordance with recent advances in statistical hydrology and improved availability of meteorological and hydrological data. Any increase in safety that might be gained by structural changes must be balanced against their costs. The risk analysis methodology known as the partitioned multiobjective risk method (PMRM) is explored in this paper through a dam-safety problem. The PMRM is well suited to the task of solving the probabilistic optimization problem posed by such risk-versus-cost considerations. With the PMRM, a number of conditional expected-damage functions are generated. Of these, one that represents events of a more extreme and catastrophic character is of particular interest. The close relationship that exists between the expectation of damage and the statistics of extremes is shown to simplify the implementation of the PMRM, and the relationship also permits the derivation of equations that determine (for any partitioning of the probability axis) the expected damage, given that a flood with a return period that equals or exceeds n years occurs. Finally, an analysis is made as to how the choice of the distribution function representing the annual flood peaks might affect the conditional expectations.

**Keywords:**
beach nourishment, coastal areas, erosion, insurance coverage, insurance purchase decision, structural approaches

**Abstract:** The paper uses the results of a nationwide survey of coastal property owners to estimate the demand for insurance against erosion damage. The survey found significant demand for insurance against erosion damage at prices in the range of current flood insurance premiums. The NFIP does not currently cover such damage, though in practice some damages may be covered: if coastal homes suffer damage from erosion during a flood-causing storm, the claim will likely be paid. However, if damage from erosion takes place in the absence of a flood, the claim will be denied. Insuring against coastal erosion losses has implications for coastal land-use management and the NFIP. The primary structural mitigation techniques for erosion damages – sea walls and groins – have been shown to have negative effects on recreational beach activities and property prices. The availability of insurance against erosion could decrease investments in these types of structural mitigation, and thus reduce their negative effects. The effects of mitigation projects on demand for erosion insurance were mixed. Property owners in proximity of a beach nourishment project were less likely to purchase erosion insurance. Property owners near structural mitigation projects such as sea walls were actually more likely to purchase erosion insurance, indicating a perception that those projects offered inadequate protection. The paper found that the demand for insurance against erosion damage was considerable and sensitive to price, income, and risk. Willingness to pay was high relative to flood insurance premiums, suggesting that mandatory erosion insurance in areas of high risk would be politically feasible.

floodplain management, Iowa, Midwest floods of 1993

**Abstract:** This article views the catastrophic rainfall and flooding in the Midwest in the larger context of regional sustainability. Converging strategies from different sources suggest that working cooperatively might achieve healthy environments and healthy economies, now and in the future, and minimize losses from disasters. The recommendations include: (a) creating demonstration projects within the area of intense 1993 flooding to illustrate ways that flood hazard mitigation and regional sustainability can advance together, (b) showcasing and monitoring exemplary programs that are already under way, and (c) considering such programs as centers of innovation waves and of voluntary adoption of sustainable land-management practices. The authors cite examples from Iowa.

building codes, coastal areas, England, hydrology and hydraulics, modeling
Abstract: The study addresses physical vulnerability of residences to flood disasters in coastal and eastern England. Specifically, the study uses examples of flooding on Canvey Island on the Thames Estuary and Kingston-upon-Hull on the Humber Estuary as case studies to examine lateral pressure from flood depth differential’s effect on structures. The author applied calculations of the rate of floodwater rise and glass and wall failure to developing a new form of vulnerability profiling: vulnerability matrices, with flood depth differential along one axis and flood velocity along the other axis. These matrices were used to illustrate the consequences of use of disaster management tools.

Keywords: communication, federal programs, methodology, Midwest floods of 1993

Abstract: In response to the Midwest floods of 1993, the Clinton Administration recognized the need to make scientific information readily available to planners, managers, and policy makers in the basin area. To acquire and begin analyzing the data, the Scientific Assessment and Strategy Team (SAST) was established in November 1993. SAST was an interdisciplinary, interagency group that also provided scientific support to the Interagency Floodplain Management Review Committee. This article discusses the major findings of SAST and a strategy to incorporate scientific information into river basin management more effectively. The findings of SAST show clearly that using scientific information when making decisions could help reduce the impact of floods. Such information and advice must be derived from a well-coordinated plan of activities that incorporates baseline information, detects changes to the system, determines the effects of changes, improves methods of predicting changes, and makes the knowledge available to the user community.

Keywords: compliance, floodplain management

Abstract: This report summarizes the results of a survey of local, state, and federal officials and private parties for recommendations for floodplain management regulations. The objective of the survey is to aid ASFPM in formulating positions to advocate for improving the NFIP. Respondents stated that current minimum regulations are inadequate and that NFIP regulations should be changed every five years. Officials were split over whether their own state or community would be willing to impose tougher restrictions on their own without federal mandate. Eighty-eight percent of respondents felt that requiring freeboard for new construction would reduce flood losses. Respondents supported prohibiting storage and disposal of hazardous materials and hazardous materials facilities in floodplains. Finally, state and local officials urged FEMA to change the practice of removing properties filled to BFE from the floodplain maps, based on the increased potential for flood damages.

coastal areas, economic modeling, erosion, property values, Virginia

**Abstract:** The report outlines an economic framework for making management decisions on tidal shoreline erosion by evaluating the impacts of coastal erosion on shore-land property and structures. It determined coefficients for estimating erosion-induced losses to property and dwellings. Lots that contained a dwelling decreased in value by an average of $0.24 for each square foot of soil lost to erosion. Decreases in the value of a dwelling due to an erosion-induced loss of distance between the dwelling and the shoreline averaged $8.64 per foot of distance lost. These values plus other measures were applied to three coastal areas in Virginia. The evaluation procedure provided a realistic basis for comparing: (a) the benefits and costs of selected erosion control measures, (b) the various levels of control, and (c) the distribution of costs of controls among property owners and between the private and public sectors.

**Keywords:**
flood disaster planning, risk communication, Scotland

**Abstract:** In January 1993 and December 1994, two areas of Scotland experienced extensive flooding and large-scale evacuation of a spontaneous and unstructured nature. Both the flooding and the evacuation left their traumatic mark on the householders. The research reported here was qualitative, with the objective of investigating the evacuation process inductively—how it operated on the ground, what were the problems, and how the process could be enhanced to maximize effectiveness for those who have to experience the consequences. This long-term or extended process of evacuation is discussed in this paper, where it is emphasized that evacuation is not complete until everyone has returned home. The elderly, children, and women are also identified by the research as groups that suffered particularly as a result of the poorly executed evacuation and which require special attention. Policy and practical recommendations are drawn from the research, which may be equally applicable to future floods in the United Kingdom and elsewhere.

**Keywords:**
Australia, flood disaster planning, legislation, public policy

**Abstract:** The plan describes arrangements for a variety of floodplain management functions and integrates those performed by the State Emergency Service (SES) with those performed by local councils. The first New South Wales State Flood Plan was issued in 1991: prior to that planning for the real-time management of flood events was largely nonexistent. The plan contains a detailed discussion of the state’s flood threat, the legislative basis for floodplain management, existing policies, and the elements of a successful floodplain management strategy.
Currently, all council areas with significant flood problems have plans for managing the consequences of flooding. Along with the Floodplain Development Manual, the State Flood Plan has guided councils in decisions related to floodplains. The paper points out that in New South Wales, flooding is the most costly natural hazard, but also the most manageable. SES’s role in floodplain management has progressed considerably over the past decade, primarily because of increased education, formal planning, and the integration of local councils.

Keywords: Australia, awareness, media, risk communication, risk perception

Abstract: The paper examines the role of the State Emergency Service (SES) in providing warnings of coming floods, describes the history of SES flood warnings, and addresses barriers to improvement. The SES was created following flooding that devastated much of New South Wales in the mid-1950s. Existing community warning and response initiatives were simple and informal. By the 1990s, considerable attention had been given to technical aspects of flood prediction, with less attention to the dissemination of predictions, their content, medium, and effectiveness in motivating property owners. Since then, SES has employed prewritten messages, dedicated media liaisons, and multiple dissemination techniques to improve the effectiveness of flood warnings. One barrier to further improvement is that floods occur relatively infrequently on most of the state’s rivers, meaning that SES personnel received little practice with actual flood disasters and floodprone communities are unaccustomed to the threat of flooding, making them less susceptible to warnings. Also, local officials lack confidence in flood prediction data and fear reprisals for unnecessary or insufficient predictions.

Keywords: Australia, awareness, disaster planning, levees, structural approaches

Abstract: The paper compares the flood preparedness in two small Australian towns, Nyngan and Warren, which experienced flooding in 1990. Both towns were protected by levees. In Nyngan, residents perceived levee failure impossible and did not consider alternative means of protection. When the levee overtopped, the results were catastrophic - $50 million in damages after the entire town was evacuated by helicopter. The town had taken no serious preparatory measures. Warren (in part warned by the experience of Nyngan) launched a large-scale multifaceted, coordinated response effort at the threat of flooding. Public utilities were sandbagged, levee banks were raised using earthmoving equipment, and the public was informed of predicted flood heights. In light of these examples, the report recommends a multifaceted approach to flood preparedness, increased education of local citizens, and expanded emergency planning.

The article classifies the types of disaster research being conducted by various stakeholders throughout Australia and determines a common and reliable methodology for each type of study. The author differentiated between two general types of studies conducted in Australia – postdisaster and posttrauma studies. Each employs different methodologies because they measure different aspects of disaster management.

**Keywords:** repetitive losses, Flood Mitigation Assistance Program, Flood Insurance Reform Act of 2004

**Abstract:** This report traces the evolution of the NFIP and provides background information on the program. It discusses the problem of repetitively flooded properties and the FEMA mitigation program. It also discusses other issues in the NFIP, such as the adequacy of claims adjusting and the 2004 Flood Insurance Reform Act of 2004.

**Keywords:** Hurricane Katrina, disaster risk management

**Abstract:** Hurricane Katrina is expected to the costliest insured loss from a single event in US history. Total losses, including insured and insured property losses, are expected to exceed $200 billion. At the time Katrina hit, the insurance industry was well-equipped with financial reserves to absorb the financial impact of claims on such a scale, having profited from favorable market conditions in recent years. The insurance industry is expected to emerge largely intact from Hurricane Katrina, but insurers remain exposed to future catastrophic disasters in every state. The Congress may be called upon to consider federal policy alternatives to build national capabilities for disaster risk management, including pre-funding disaster costs with insurance or securities.

**Keywords:** attitudes, Australia, awareness, communication, media, risk communication

**Abstract:** This article lists the measures taken by the community of Bandswood to warn residents about flood dangers and to prepare them for flood damage. The article notes that the community has adopted a multifaceted flood warning and flood awareness strategy that includes flood warning notices, informational brochures, and flood level signs. The article concludes that
using a variety of media that reinforce a message about flood danger is an effective means of evoking appropriate responses from at-risk populations.

**Keywords:**
health effects, relocation

**Abstract:** Residential relocation is one means of coping with living in a perceived high-risk area. An analysis of a sample of household members who live in such an area showed the extent to which fear of recurring emergency events affects attitudes toward seeking an alternative safer area in which to reside. Intent to relocate is linked to specific subgroups of families on the basis of how they comprehend the risks of remaining (educational level) and the extent of possible economic damage (level of assets). A series of independent variables reflected affective-emotive behavior during the disaster. Post crisis trauma related attitudes, and pre/post disaster neighborhood bonds were likewise linked with an intention to move to a safer neighborhood. A regression model focused the analysis on the degree to which concern of psychological damage to children played a decisive role in determining a decision to relocate.

insurance

**Abstract:** This chapter assesses the role that insurance regulation has played in society’s response to disaster risk and identifies the issues that must be addressed in evaluating how regulatory policy might be modified to help lower disaster costs and support a more efficient and equitable way to finance them. The chapter provides a brief overview of the structure of insurance regulation, focusing on its primary institutions and functions. The author also provides a detailed evaluation of the areas of regulation that most relevant to insuring disaster risk (e.g., regulation and its effect on availability and price and control of market entry and exit) and the options available to regulators to improve market conditions (e.g., financial regulations, policy forms and coverage requirements, rates, underwriting restrictions, and claims adjustment).

**Keywords:**
California, Florida, mitigation, modeling, risk communication

**Abstract:** In this article the authors utilize computerized risk-mitigation measures (RMMs) models to examine the effect that risk mitigation increases would have on property owners and insurers. With this technology, the authors constructed statistical models of two earthquake-prone cities mimicking Oakland, CA, and Miami-Dade County, FL. They examined the reduction in damages that increased use of RMMs would have on these areas. In addition, they studied the effect that increased use of RMMs would have on the performance of two prototypical insurance companies, one small and large insurance company. The computer models
indicate that mitigation would reduce aggregate losses to the insurer and the homeowner in both Oakland and Miami. If all homeowners mitigate in Oakland, the expected annual loss is $2.38 million. If all households in Miami employ RMMs it would reduce the total cost to homeowners by $1.46 million. Given the result that RMMs do save money for homeowners, insurers, and taxpayers, why are these groups of people not doing more to mitigate risk? The study suggests that homeowners do not invest voluntarily and insurers do not reward such investment behavior because of existing policies and decision-making limitations concerning their ability to judge and prepare for the consequences of rare events. Moreover, existing government programs dull the incentives for individuals and institutions to prepare for catastrophic natural disasters. A prescriptive approach would be to advocate insurance and mortgage reform so that the key players in the housing market would have the incentive to encourage homeowners to mitigate.

**Keywords:** Community Rating System, Illinois  

**Abstract:** The study documents the flood risk in the Village of Wheeling, IL, and prescribes its optimum level of participation in the CRS program. The community adopted a floodplain management ordinance in 1963 and became part of the regular NFIP in 1978. It had 478 policies at the time of the study. After applying to the CRS program in 1990, it obtained a Class 9 rating, the maximum for a first-year applicant. The study addresses what CRS creditable activities are economically feasible and viable for the Wheeling to implement, compares the village’s CRS application to others submitted nationwide, and finally prescribes activities for the village to optimize its CRS class rating. An evaluation of feasible activities found that there were additional points that could be obtained in three of four sets of activities. If all of the activities identified to be feasible for Wheeling were implemented, the village would qualify for a Class 7 rating. By optimizing potential point totals in three activities – a Flood Warning Program, an outreach program directed at repetitive loss properties, and amendment of stormwater management requirements – Wheeling could boost its CRS rating to Class 7. The village was well over the national average in points obtained for the top six creditable activities, due in part to the large portion of the town in the SFHA and the high number of policies in force.

**Keywords:** agriculture, flood damage, Hurricane Floyd, North Carolina

**Abstract:** Industry sources say that although big commercial policyholders and agricultural operations in North Carolina are likely to be insured for damages resulting from the severe flooding caused by Hurricane Floyd, most small businesses and individual property owners will likely be uninsured for those losses. According to Scott Ellwanger, manager of claims at FM Global in Park Ridge, IL, most large commercial policyholders use flood insurance from FEMA as a primary layer and reinforce this with excess coverage from a commercial property insurer. However, JoAnn Howard, Federal Insurance Administrator, says that typically only 25 to 50 percent of home and business owners in flood-prone areas buy flood insurance. This article also
discusses the flood damage caused by Hurricane Floyd to farms and businesses in North Carolina.

Keywords:
Netherlands, flood control, insurance, flood damage

Abstract: Potential losses resulting from flooding in the Netherlands are enormous. Estimates place losses in the order of 100 billion Euro (€) resulting from coastal flooding and €50 billion from riverine flooding. Recently, relatively small riverine flooding occurred in December 1993 (loss of €100 million) and January 1995 (loss of €80 million). In September 1998, heavy rainfall occurred, causing losses of some €500 million. A combination of damage sharing and construction of flood defenses has traditionally been applied in the Netherlands. This paper examines the idea of whether flood insurance could be added to the current approach. Insurance of whatever form is a tool for spreading negative consequences rather than removing them. The authors conclude that insurance for catastrophic flood events seems to be unattractive but that insurance for smaller floods may be attractive.

Keywords:
attitudes, California, communication, Florida, Iowa, lending institutions, marketing, Write Your Own Program

Abstract: FEMA sponsored this research to ascertain public attitudes toward disaster planning, particularly in regards to insurance coverage. The report is based on in-depth telephone interviews with three Write Your Own (WYO) agents, four independent agents, and three lenders in Broward County, FL; Des Moines, IA; and Santa Clara County, CA. The report summarizes findings but does not detail methodology or results. It reveals that agents have a poor understanding of FEMA’s role and its relationship to the NFIP and few had direct contact with FEMA. Agents are generally satisfied with the status quo and do not prioritize flood insurance. Lenders feel like they know little about FEMA and the NFIP and they would like more contact with FEMA. The report concludes that communication between FEMA and lenders and agents merits improvement and lists suggestions from lenders and agents. Most of those interviewed agreed that the public is not well informed about flood insurance, what it covers, and why they need it. Lenders felt a national advertising campaign was the best way to increase awareness in the public and among lenders. Agents were less open to a public education campaign believing that the public would not trust the government to sell them insurance. The report concludes that if those stakeholders interviewed are not invested in the NFIP’s goals, then they will have only limited interest in selling flood insurance. Therefore, an effort should be made to develop and maintain a strong relationship with these groups to generate more interest in the purchase of flood insurance.

**Keywords:**
communication, insurance purchase decision, marketing, risk communication

**Abstract:** This document report looks at consumer and business decision-makers’ attitudes towards and understanding of flood insurance. KRC Research & Consulting conducted a quantitative research study during September and October of 1995 and surveyed 1,200 consumers and 600 business decision-makers (1/3 of the total sample obtained from high-risk areas, 2/3 from a random national sample, in each case) by telephone. This report concludes that:
(a) FEMA and NFIP are not well known among either consumers or business decision-makers;
(b) 52 percent of consumers and 40 percent of business decision-makers who know FEMA view it favorably;
(c) floods and hurricanes are top-of-the-mind natural disasters for most respondents, but few feel personally threatened by floods (even those who live in high-risk areas);
(d) in the event of a flood, most would expect their insurance company to cover damages;
(e) about half of each group think the government should pay for clean up and repair after a natural disaster;
(f) about half of each group has taken precautions in the event of a natural disaster (efforts vary but most often include references to insurance: 24 percent of consumers and 43 percent of businesses); and
(g) while most consumers think flood insurance is a wise investment (65 percent), most business decision-makers don’t (37 percent). Based on these findings, this report recommends that FEMA: (a) get the NFIP on the map, using any and all means possible; (b) break through the assumption that fires are a greater danger than floods; (c) educate people about the measures of risk and convince them to ask their agents to make sure they have flood insurance; (d) educate the target audience as to exactly what flood insurance covers; (e) explain the concept of a federal disaster area; (f) tell the target audience that flood insurance is available through an insurance agent and that it is relatively inexpensive; and (g) use a flood victim as a spokesperson instead of a fictional character.

**Keywords:**
awareness, communication, insurance purchase decision, marketing

**Abstract:** FEMA retained KRC Research to conduct qualitative research with four key audiences—lenders, realtors, community officials, and members of an advisory board—to help guide the development of strategies and creative messages to facilitate the sale of flood insurance. In August 1995, KRC conducted 27 in-depth interviews with these key audiences. This report summarizes general perceptions of the insurance industry, obstacles to understanding the flood insurance industry, perceptions of the NFIP, the public’s decision-making process, and suggestions for an awareness-raising campaign. Respondents felt that lack of knowledge about flooding, risk, and insurance is the primary reason people do not own flood insurance. Eligibility and coverage are major areas of confusion. While advisory board members have a good knowledge of the NFIP, the other respondents are largely ignorant about the program. The four constituencies agreed that the insurance industry does not have a good public image and that disaster insurance is generally unprofitable. They felt that retention is mainly the result of compliance with insurance requirements. All respondents felt that an education campaign is critical to improving the volume of flood insurance sold. They called for improved
communication between the NFIP, themselves, and the public, and they expressed enthusiasm for an advertising campaign.

**Keywords:** risk perception

**Abstract:** This report evaluated risk perceptions among residential homeowners and the effect on flood insurance purchase decisions. Some of the results run counter to conventional wisdom about public education and awareness levels and the impact on flood insurance purchase. Flood insurance was not entirely tied to the perception of risk. The study found a considerable portion of uninsured consumers (over one-third) who felt threatened by the risk of flooding but did not carry flood insurance. Other factors must have impacted the insurance purchase, or non-purchase decision. The authors found a significant lack of awareness among survey respondents. Many consumers were simply unaware of flood insurance and the measures available to them for protection in the event of a flood. This factor constituted a significant factor in the failure to purchase flood insurance. Also, many people who did not carry flood insurance believed they are covered under homeowners or other casualty insurance. Further questioning of residents unaware of the availability of flood insurance found a general consensus that if it was important or if they were at risk, their lender or insurance agent would have told them about it. However, not all insurance agents or lenders are familiar with flood insurance, and flood insurance agents may not have a realistic impression of their clients’ flood risk. Misconceptions and a lack of awareness were found in commercial decision-makers as well. They lacked accurate information about flood insurance and did not believe that they would experience a flood. Furthermore, many commercial decision-makers believed that business interruption insurance made flood insurance redundant. Increasing the knowledge level of consumers and insurance agents may help to overcome some of the barriers that keep people from understanding and purchasing flood insurance. Indeed, qualitative research indicates that people who are more knowledgeable about the costs and benefits of having flood insurance are more likely to find value in the product. Increasing consumer knowledge is accomplished primarily through public education, flood warning systems, and also exposure to floods. Further research is needed to quantify the extent to which education and training affects perceptions of risk.

**Keywords:** communication, insurance agents, risk communication

**Abstract:** KRC conducted a quantitative 20-minute telephone survey to investigate insurance agents’ knowledge, perceptions, practices, attitudes, and beliefs about what flood insurance covers; writing policies; and the benefits of flood insurance. The survey contained two components, one with a nationally representative sample of 300 agents who sell flood insurance (flood agents), and another with 100 agents who do not sell flood insurance (nonflood agents). The survey reveals that flood agents are much more aware of and favor FEMA and the NFIP than nonflood agents. Second, in both groups, the decision to sell flood insurance is closely related to the agents’ opinions of flood risk in the area where the client resides. Nine of 10 agents would be more inclined to recommend flood insurance if they learned their clients were in areas
with a high risk of flooding or that a flood was predicted for their client’s area. Third, it may be difficult to sell flood insurance to clients who do not believe they are at risk or who think that the insurance is too expensive. Communications should continue to emphasize that virtually everyone is at risk for flooding, and that flood insurance is not as expensive as some might think. Fourth, flood agents are more likely to know that floods are likely to occur even in areas not designated as floodplains and therefore know that these people also need insurance. Fifth, the majority of flood agents believe that flood insurance is a wise investment, offering excellent coverage at a fair price. In contrast, nonflood agents do not think it is a wise investment given current levels of coverage and the price. Sixth, flood insurance is not seen as an overly difficult policy to write, but the rating system and the process of obtaining elevation certificates are seen as more difficult and time-consuming. Most agents indicate that learning that there is an easy-to-write policy available for 90 percent of homeowners would prompt them to recommend flood insurance. Agents aware of the Co-op Advertising Program believe it to be a good one.

Keywords: awareness, communication, marketing, NFIP

Abstract: This report details the ninth wave of tracking research to assess the attitudes of consumers and business decision-makers (BDMs) regarding the need for, and understanding of, flood insurance and the success of an advertising campaign. Conducted from January through April 1999, FEMA Quantitative IX consisted of telephone interviews with 1,200 consumers and 600 BDMs from a random national sample and from high-risk areas. The study assessed perceptions of natural disasters in general but floods represented the primary focus. The study considered flood risk, insurance companies and agents, awareness and perceptions of FEMA advertising, and knowledge of flood insurance. KRC found the percentage of consumers and BDMs who, in the last two months, saw or heard an ad for flood and/or disaster insurance. The firm then determined the messages these listeners received from the ad and ascertained the awareness of and favorability toward FEMA and the NFIP. The report concludes that the advertising campaign continues to increase familiarity and favorability toward FEMA and the NFIP among consumers and BDMs, but the percentage of respondents who are aware of the ads could be higher. KRC recommends that FEMA: (a) spend more on the campaign, (b) continue to emphasize that floods can happen anywhere and make the connection between flooding and permanent water damage, (c) make the point that flood insurance is a wise investment, (d) include a single response mechanism at the end of the ad, (e) communicate that floods often occur alongside hurricanes and that current coverage may be insufficient, and (f) inform insurance agents about the risk of flooding and about the ease with which flood insurance may be written and serviced.

Keywords: coastal areas, economic modeling, insurance purchase decision, risk assessment

Abstract: The authors analyze how a household decision to purchase flood insurance relates to other measures of risk reduction and particular aspects of flood and erosion risk. They argue five
reasons why the NFIP does not have a higher rate of participation among property owners at risk of flooding: (a) government disaster relief programs provide a disincentive for purchasing flood insurance; (b) people tend to underestimate their chances of being a disaster victim; (c) the NFIP may undercompensate for losses; (d) coastal property owners regard the expected value of the potential loss as only a small part of their total wealth; and (e) the model’s results apply only to risk-averse individuals. Results indicate that the variables of income, waterfront (percent of properties that have frontage on the water), armor (percent of survey returns indicating the existence of coastal armoring at the nearest shore), elevation, post-FIRM status, mortgage, location in the Pacific Region, and location in the Gulf Region have significance (at the .05 level or below) in predicting the proportion of a community’s properties protected by flood insurance.

Keywords:
coastal areas, insurance purchase decision, mandatory purchase

Abstract: The report addresses NFIP participation in coastal areas. Its empirical analysis of data from a sample of nine coastal counties revealed that the participation rate in the NFIP is 49 percent of eligible properties. Under current NFIP regulations there is no consideration of the added risk presented by coastal erosion. The operation of the NFIP in coastal areas deserves special attention because of several key differences with riverine flood zones, including the fact that coastal areas generally contain more valuable properties that can easily exceed the $250,000 claim limit of the NFIP. This would raise the possibility of undercompensation, in which only part of a potential loss is covered. However, only 3.5 percent of homes in the author’s data set were valued at more than $250,000. Coastal property owners may also self-insure, by locating further away from the shoreline, foregoing upgrades to their structure, or employing artificial coastal protection, such as seawalls and beach renourishment. The analysis of NFIP participation in coastal areas utilized an on-site survey, FIA policies-in-force data, mail-survey questionnaires, and the FEMA website. The results suggest that the price of flood insurance has a negative effect on participation, though with a low degree of price responsiveness. Respondents with higher incomes were more likely to have flood insurance. Also, households located in the vicinity of artificial shoreline protection are 12 percent more likely to purchase flood insurance, suggesting that the presence of shoreline protection heightens owners’ awareness of the risk inherent in their location. Mortgaged property is 73 percent more likely than nonmortgaged property to have flood insurance. The conclusion of the report is that adjusting premiums for NFIP policies in coastal areas in the range of $0.08 to $1.18 per $100 coverage would probably not cause significant change in NFIP participation. Factors besides price, such as proximity to the shoreline, the existing community response to erosion and storm risk, and mortgage lender requirements, were important to the probability of participation.

Keywords: coastal areas, economic modeling, environmental impacts, erosion, insurance coverage, insurance purchase decision, public policy, property values, risk assessment

Abstract: This study examines the economic effects of flood insurance pricing and availability, as they relate to housing values, the local community, and the coastal ecosystem. Three types of changes to the NFIP are being considered: 1) a change in the cost of insurance, 2) denial of flood insurance, 3) a change in the rules that apply to coverage of erosion-related damage. Five sections of the report describe general results of a mail survey, a hedonic price analysis, an empirical model of property owners’ decisions to buy flood insurance, an experiment on how property owners might respond if additional erosion-damage coverage were offered under the NFIP, and how property values decline if beach recreation is adversely affected by coastal armoring. Overall, the study finds that hazards from flooding and erosion, and the actions taken against them significantly determine property values in coastal areas. However, flood insurance was not found to have an important role in the real estate market. Furthermore, the demand for flood insurance was found to be unresponsive to price changes. A prohibition on new construction within the 60-year erosion hazard area would increase property values and perhaps reduce disruptions to the coastal ecosystem if the parcel of land is sufficiently large. Coastal armoring increases the value of waterfront properties but if the recreational beach is damaged, then the value of inland property will be reduced sharply.

Keywords: environmental protection, floodplain management, wetlands

Abstract: The NFIP was designed to reduce loss of life and property from floods. Part of the program’s responsibility involves the development and enforcement of floodplain management standards to reduce flood damages. Regulations recently adopted require that communities wishing to qualify for the program protect mangrove stands and dunes that act as barriers to storm surges. The program also indirectly protects wetlands in several ways: it establishes disincentives for location of structures in areas of known flood risk; it prohibits the use of fill for elevation purposes in identified coastal high hazard areas; and it encourages the use of columns for elevation to minimize the use of fill. The article also discusses recent executive orders concerning wetlands and floodplains and their relation to the NFIP.

Keywords: Germany, insurance, insurance industry, NFIP

Abstract: The report begins by differentiating types of floods, describing recent flood disasters worldwide, defining risk, and outlining some of the reasons for increasing flood risk. A partnership of public authorities, at-risk populations, and the insurance industry is necessary to reduce risk. In the case of catastrophic flood disasters, insurance companies may be unable to
cover the losses generated by the event. For instance, roughly a dozen primary insurance
companies were bankrupt following Hurricane Andrew in 1992. In these cases, reinsurance
companies – insurance for insurance companies – play an important role worldwide. The paper
describes tactics reinsurance companies use to reduce flood losses and overcome such problems
at adverse selection. These tactics include the creation of hazard zones and the assessment of
probable maximum loss (PML). Hazard zoning allows reinsurance companies to calculate the
expected losses an insurance company would face as a result of a disaster. Munich Re developed
the world's first flood loss accumulation model for an entire country, utilizing hazard zone
models. Similar models are being developed for the United Kingdom.

Krutilla, John V. (1966). An economic approach to coping with flood damage. Water
Resources Research, 2(2), 183-90.

Keywords: economic modeling, flood control, insurance premiums, mandatory purchase
Abstract: A compulsory flood insurance scheme is one means of achieving efficient uses of
floodplains. Insurance premiums proportional to risk and equal to both the private and social cost
of floodplain occupancy will serve as a rationing device, eliminating economically unwarranted
uses of floodplains on the one hand, while not prohibiting uses for which a floodplain location
has merit on the other hand. In addition, reduction of flood insurance premiums can serve as a
standard to measure the economic justification of alternative flood control measures and/or
discrete increments in scale of protective works or other nonstructural flood control measures. A
final advantage of flood insurance, which no alternative in flood management possesses, is
indemnification for the residual damage potential against which it is not economical to seek
protection.

Kuczera, George. (1983). A Bayesian Surrogate for Regional Skew in Flood Frequency

Keywords: modeling
Abstract: The problem of how to best utilize site and regional flood data to infer the shape
parameter of a flood distribution is considered. One approach to this problem is given in Bulletin
17B of the U.S. Water Resources Council (1981) for the log-Pearson distribution. Here a lesser
known distribution is considered, namely, the power normal which fits flood data as well as the
log-Pearson and has a shape parameter denoted by lambda derived from a Box-Cox power
transformation. The problem of regionalizing lambda is considered from an empirical Bayes
perspective where site and regional flood data are used to infer lambda. The distortive effects of
spatial correlation and heterogeneity of site sampling variance of lambda are explicitly studied
with spatial correlation being found to be of secondary importance. The end product of this
analysis is the posterior distribution of the power normal parameters expressing, in probabilistic
terms, what is known about the parameters given site flood data and regional information on
lambda. This distribution can be used to provide the designer with several types of information.
The posterior distribution of the T-year flood is derived. The effect of nonlinearity in lambda on
inference is illustrated. Because uncertainty in lambda is explicitly allowed for, the
understatement in confidence limits due to fixing lambda (analogous to fixing log skew) is
avoided. Finally, it is shown how to obtain the marginal flood distribution which can be used to
select a design flood with specified exceedance probability. (Author's abstract)

**Keywords:**
flood disaster planning, Midwest floods of 1993, modeling, weather

**Abstract:** Effective responses by government agencies, businesses, and private industry to climate disasters like the Mississippi River flood of 1993 hinge on the regional availability of up-to-date weather, climate, and water information. In addition to the obvious need for accurate forecasts and warnings of severe weather and floods, other types of meteorologically based information can contribute to effective responses. Some examples of information requested during and after the 1993 flood include hydroclimatic assessments of the magnitude of the event, agricultural assessments of the impacts of heavy rains and flooding on corn and soybean production, and probabilistic outlooks of the recurrence of flooding based on soil moisture conditions. The authors conclude that quick responses to these needs necessitate: a real-time climate monitoring system, physical models to assess effects and impacts, and scientific expertise to address complex issues.

**Keywords:**
disaster assistance, insurance purchase decision

**Abstract:** This article points out that the federal government has given substantial relief to victims of natural disasters in recent years, largely because such individuals often are not protected by insurance. Standard insurance protects against fire, wind, and hail; flood and earthquake policies can also be purchased, but most residents of hazard-prone areas have not done so. Recent empirical findings support a bounded rationality model of individuals’ decisions about unlikely, though potentially severely harmful, events which indicates that individuals must be made graphically aware of the need for insurance to consider purchase. The author concludes that informal networks of friends and neighbors guide those who decide to do so.

**Keywords:**
insurance purchase decision, risk perception

**Abstract:** This chapter addresses the impact of natural disasters on insurance purchase decisions, specifically hazard insurance purchase and renewal. The study found increases in the purchase of hazard insurance policies following a flood or earthquake. However, once the salience of the event dissipated some residents dropped the policies they purchased. Additionally, evidence shows that renewal rates for flood insurance policies are lower than for other types of coverage. One possible explanation for lower renewal rates for flood insurance is that responsibility for the cost of recovery following a flood falls only on those people who were directly involved in the
event (i.e., those who live or have businesses in a floodplain). Those who have not been directly
impacted are not forced to reassess their own flood hazard risk.

and Uncertainty, 12*(2-3), 171-87.

**Keywords:**
Hurricane Andrew, insurance industry, lending institutions, mitigation

**Abstract:** Losses from natural disasters have increased in recent years due to population
increases in hazard-prone areas and inadequate enforcement of building codes. This article
contends that until recently, insurers viewed their role as a pass-through mechanism rather than
as a promoter of safety. Following Hurricane Andrew, the insurance industry has taken a new
view toward mitigation measures because of the severe losses that they incurred. The article
proposes a disaster-management program that utilizes insurance coupled with well-enforced
building codes to reduce future damage. Banks and financial institutions play a key role in this
program by requiring inspections of homes as a condition for a mortgage. New forms of
reinsurance coverage against catastrophic losses from natural disasters are necessary to protect
insurers against potential insolvency from the next mega-disaster.

Howard Kunreuther and Richard J. Roth, Jr., eds. *Paying the Price: The Status and Role of
Insurance against Natural Disasters in the United States*. Washington, DC: The Joseph
Henry Press.

**Keywords:**
Hurricane Andrew, insurance purchase decision, risk communication

**Abstract:** The author looks at the market for insurance against natural disasters by addressing
the following questions: What are the factors influencing property owner’s demand for
insurance? Why are insurers reluctant to provide coverage against hurricanes, floods, and
earthquakes? Regarding the demand for insurance, the author concedes that what determines the
demand for insurance when individuals have the freedom to specify coverage limits is still not
well understood. Many homeowners at risk are not anxious to purchase insurance voluntarily
because they feel the disaster will not happen to them. Others who have compared premiums
with potential benefits may feel that insurance is not a good investment. The author also points
out that the framing of the insurance decision process is relevant. For instance, some factors that
may encourage individuals to buy an insurance policy against natural disasters are the vividness
of the media’s reporting, the use of rebates so that policyholders feel they have experienced a
gain if they do not collect their policies, and the use of the status quo as a reference point. On the
supply side, the author argues that private insurers are averse both to risk and ambiguity, which
make them follow a safety-first approach in their business decisions (in other words, the author
suggests that insurers are first concerned with the safety of their firms, and then, with profit
maximization). Therefore, the author concludes that private insurers have been reluctant to
promote coverage against hurricanes, floods, and earthquakes because of uncertainty regarding
the risk and because of concern with what the financial consequences of a natural disaster would
be for their companies. Hurricane Andrew and the Northridge earthquake were wake-up calls for
many firms, alerting them to the possibility of insolvency following another major event. The
author suggests several measures to improve the market for insurance against natural disasters.
He implicitly argues in favor of reducing the ambiguity insurers and individuals face. Some of
the measures the author suggests are the provision of better information on cost-effective mitigation alternatives, as well as better enforcement of current policies (e.g., building codes). The author argues that public sector agencies have the role to assist low-income families in adopting cost-effective measures. Finally, because public sector damage from natural disasters results in a large cost to taxpayers, the author suggests that government officials should be encouraged to purchase insurance for public structures and invest in cost-effective risk reduction measures.

**Keywords:**
disaster planning, modeling

**Abstract:** This paper discusses an interactive modeling system to support policy analysis for dealing with flood hazards. Policy analysis in this area is complex because there are diverse stakeholders with varying concerns, there are a variety of scenarios that might be considered, and there are similar alternative policy options. These conditions require that a modeling system be flexible and support users in a variety of ways. The system should be viewed as a decision aid rather than a burden. The modeling system described in the paper can achieve these goals for micro-analytic models and handle samples of homeowners in a flood-prone community.

**Keywords:**
enforcement, insurance purchase decision, NFIP

**Abstract:** This paper discusses the NFIP’s objectives and accomplishments. Due to the NFIP’s apparent failure to meet its original objectives, the article provides several hypotheses that should be tested. Concerning the demand for insurance, the article hypothesizes that the failure of most floodplain dwellers to purchase insurance when not required to do so is due primarily to their belief that a damaging flood will not occur during their occupancy of the structure. It also conjectures that underinsurance is due to the limited enforcement by banks and other lending institutions of the required coverage. With respect to the supply of insurance, the article hypothesizes that there are limited financial incentives for private insurance agents to promote flood coverage. The authors make five recommendations related to increasing the coverage under the NFIP and increasing the quality and use of flood mitigation activities.

**Keywords:**
Florida, Hurricane Andrew, insurance industry, insurance purchase decision, liability, mitigation

**Abstract:** This book reviews reasons for consumer resistance to flood insurance purchase. It considers the effectiveness of insurance coverage for low-probability, high-consequence events such as natural disasters and how insurance programs can successfully be used with other policy tools, such as building codes and standards, to encourage effective loss reduction measures. The
authors discuss the reasons for the dramatic increase in insured losses from natural disasters since 1989 and the concern that insurers have about their ability to provide coverage against more such events in the future. It addresses why there has been an increasing demand for hazards insurance, what types of coverage private insurers are willing to offer, and the role of reinsurance and public-/private-sector initiatives at the state and federal levels for providing protection to victims of natural disasters. Detailed case studies of Florida in the wake of Hurricane Andrew in 1992 and California in the wake of the Northridge earthquake in 1994 reveal the challenges facing the insurance industry as well as other concerned stakeholders. The NFIP illustrates how a public-/private-sector partnership can mitigate damages and provide financial protection to victims. The book identifies new initiatives for reducing future losses and providing funds for recovery through cooperation by the relevant parties.

Keywords: coastal barriers, development, floodplain management

**Abstract:** The author looks back to the 1970s at the use of federal regulations, including flood insurance, as one element of a national strategy to manage floodplains. The author has concern that during the NFIP’s emergency phase, the program had encouraged unwise floodplain and wetland development in coastal areas or barrier islands. The author also points out that, although it is difficult to separate the importance of insurance from other factors that foster development, most research tends to support the idea that the flood insurance program has encouraged development.

Keywords: environmental restoration, Midwest floods of 1993

**Abstract:** Efforts by federal, state, and local governments to restore wetlands and floodplains after the flood of 1993 provided many lessons that should be applied in future efforts. Floods do create restorative opportunities. But, there are also severe impediments to restoration in postflood contexts given the limited statutory goals of post disaster programs that do not address the restoration of natural systems, the narrowly targeted funding, the lack of preflood assessments and plans, the lack of coordination of agency efforts, and the need to deal with immediate and real suffering and human needs. New institutional mechanisms are needed both to identify general restoration opportunities prior to flood events as part of broader ecosystem management planning and to rapidly assess specific restorative opportunities after a flood event. The article lists several specific recommendations (consistent with the overall recommendations of *Sharing the Challenge*) both for the Mississippi Basin and other future contexts.

Keywords: floodplain management, legal issues and litigation, No Adverse Impact, takings

Abstract: The paper examines legal issues concerning floodplain management, including the No Adverse Impact approach to floodplain management, in which a community implements a goal to not increase flood peaks, flood stage, flood velocity, erosion, and sedimentation in public works projects, regulatory permitting, and other activities. The paper considers the relationship between No Adverse Impact and property owner common law rights and duties regarding flooding and erosion. The author finds that the No Adverse Impact approach conforms to the standard used by courts; “so use your own property that you do not injure another’s property.” With regard to floodplain management, this standard means that no property owners have a right to use their land in a manner that substantially increases flood or erosion damages on adjacent lands. Communities that adhere to the No Adverse Impact approach will decrease the potential for successful liability suits from damage caused by development. The report also addresses the constitutionality of floodplain regulations that incorporate No Adverse Impact standards. It finds that courts are likely to uphold community regulations that adhere to the No Adverse Impact approach against claims of “takings.” Courts have consistently upheld floodplain regulations that exceed minimum NFIP requirements. The paper expects that the “takings” agreement will receive traction from courts only where floodplain regulations permanently deny all economic use of floodplain properties.

Keywords: alluvial fans, coastal areas, erosion, ice jams

Abstract: This report identifies types of flood hazard areas, such as alluvial fan and ice jam flooding areas, where special risks are posed to life and property and existing floodplain management practices are inadequate. The report describes the federal, state, and local approaches to dealing with such areas, and recommends improvements. Flood hazard areas of special risk are widespread and prevalent and contribute greatly to insurance losses. Existing mapping, regulatory, and insurance approaches do not adequately account for characteristics of special risk areas, such as velocity, debris in the water, and flooding of extended duration. Lack of data on flood risks and insufficient dissemination of information are two obstacles to managing areas of special risk that may be overcome by programmatic improvements.

Keywords: environmental impacts, floodplain management, nonstructural approaches

Abstract: The authors point out that traditional floodplain management emphaisizes structural changes such as dams, levees, channel alteration, and shoreline protection. Other impacts of flooding are ignored because approaches emphasize minimizing structural losses. These impacts include deterioration in water supply, erosion, sedimentation, nonpoint source water pollution, or damage to wetlands and natural habitats. The authors suggest bringing floodplain management under the umbrella of broad, multi-objective watershed management planning, and emphasize the importance of local community participation in such an approach. Their approach requires a
change in the role of federal agencies from “supermanagers” of the nation’s floodplains to facilitators of state and local programs. The authors acknowledge that bureaucratic inertia and opposition from certain interest groups may make such an approach difficult to implement, but they maintain that the benefits would ultimately justify the effort.

Keywords: floodplain management, public policy, zoning
Abstract: Of the land-use controls required as prerequisites for participation in the NFIP, the local floodplain management ordinance receives primary attention in this report. The report describes the place of the zoning ordinance in comprehensive floodplain management by introducing planners to the major elements that should comprise a local ordinance. The central findings of case law on floodplain regulations to date are summarized in Part IV. In Part VI, the kinds and sources of hydraulic data are classified and then the utility of those data for developing legally valid ordinances is described in text and drawings. The report concludes with text for a local floodplain management ordinance, with modifications therein to fit the conditions of four hypothetical communities.

Keywords: floodplain management, legal issues and litigation, legislation, zoning
Abstract: This bibliography contains materials devoted primarily to the legal aspects of floodplain regulations including floodplain zoning and management. In addition, the bibliography covers the economic aspects of flood insurance; the planning, engineering, and geographic aspects of floodplain management; government documents and publications; as well as abstracts on land-use planning.

Larsen, Steven and James Benoit. (2004). Report to the County Executive of Baltimore County, Maryland On the Response to Flood Victims of Hurricane Isabel By Insurance Companies and Agencies of the State and Federal Government. Baltimore, MD: Saul Ewing LLP.
Available at: http://resources.co.ba.md.us/Documents/Executive/insurance_report040209.pdf
Keywords: awareness, Hurricane Isabel, insurance agents, insurance claims, insurance coverage, Maryland, Write Your Own Program
Abstract: The report presents the results of an evaluation, commissioned by the County Executive for Baltimore County, to assess the responses of private insurers and state and federal agencies to victims of Hurricane Isabel in Baltimore County in 2003. The survey found a majority of respondents sustained damages greater than 50 percent of the assessed value of their home. Ninety-seven percent stated that the amount offered by their flood insurer to settle their flood claim was inadequate for the damage they had sustained. Respondents also ranked the distribution of information poorly: 85 percent stated they had not received sufficient information from their agent and/or insurer about the types of damage covered by the homeowner’s policy, the need for flood insurance, the type of damages covered under a flood insurance policy, and the
amount of coverage needed. Insurance agents and federal, state, and community officials received low marks for their helpfulness and coordination. The authors recommend Congress reconsider the limits for coverage for flood policies, including linking contents coverage to building coverage. It was also apparent from the survey results that the NFIP ought to specify more rigorous requirements from WYO company training. Furthermore, homeowner outreach and education, through the production of comprehensive, informative literature, need to be improved. The issue of unsettled claims created significant public resentment and in the author’s opinion, requires the NFIP to conduct an inventory of unsettled claims and seek to close them.

Keywords: agriculture, Midwest floods of 1993

Abstract: In this commentary, the author agrees with the analysis and conclusion of an article by Mary Fran Myers and Gilbert F. White dealing with the 1993 floods in the Midwest. He discusses farmers and the lack of levee protection, farmers’ concerns about environmental groups, and the desire to change farmland to protected wetlands.

Keywords: development, economic impacts, floodplain management, mitigation, public policy

Abstract: Annual flood losses in the nation continue to worsen despite 75 years of federal flood control and 30 years of the NFIP. This trend is due primarily to federal policies that have encouraged at-risk development, provided for insufficient consideration of the impact of that development on other properties and on future flood and erosion potentials, justified flood control projects based on a cost-benefit ratio that favors an intensification of land uses within the floodplain, and engendered an unhealthy reliance on federal resources by state and local governments. The authors propose a new “no adverse impact floodplain” approach that shifts the focus from the techniques and standards used for flood-prone development to how adverse impact resulting from those land-use changes can be planned for and mitigated. The proposed policy promotes community involvement and planning, sustainable development, and local land-use management, with consideration for private property rights.

Keywords: Louisiana, mitigation

Abstract: This article summarizes efforts by floodplain managers to encourage homeowners to take action on their own property to minimize flood damage. The author challenges earlier conclusions that homeowners would not be involved in mitigation efforts. Using case studies from Slidell, LA, in 1983, about 18 months after major flooding had occurred, the article shows that homeowners who had experienced recent flooding are interested and willing to participate in mitigation. The author than examines recommendations for improving homeowners’ involvement in mitigation and considers changes in the roles of federal, state, and local government.

**Keywords:**
awareness, Pennsylvania, risk communication

**Abstract:** The authors point out that since the late 1960s, the federal government emphasized flood insurance as the primary tool for improving construction location, informing flood-proofing decisions, and providing reimbursement for flood damage. Interviews conducted with 22 residents of three flood-vulnerable communities in Pennsylvania reveal that most respondents had little knowledge of the cause of floods or of what could be done to protect themselves and their property. The authors conclude that there was little effective communication about the nature and magnitude of flood risks or of the measures people can take to lessen physical and economic loss. The authors suggest the need for a risk management program that emphasizes more adequate communication as well as the enforcement of the current (1991) law requiring people at risk and who hold federally funded loans to have flood insurance.

**Keywords:**
coastal areas, Delaware, development

**Abstract:** This report focuses on North Bethany Beach, a coastal community in Delaware. The author concludes that the availability of flood insurance has had no real impact on coastal development. In contrast, the availability, or lack thereof, of flood insurance has had a negative effect in the development of low-priced lots. The author argues that the main factors that promoted beachfront development among the affluent were, in order of importance: proximity to major metropolitan areas, limited supply of desirable property in the face of increasing demand, lifestyle issues, elite development with private beaches, and the strength of the economy. The availability of flood insurance is, according to the author, much less of a factor.

**Keywords:**
Florida, Hurricane Andrew, insurance agents, liability, modeling

**Abstract:** The authors contend that of hurricanes that struck Florida in the 1990s, Hurricane Andrew in particular, revealed the precarious financial position of many insurers in the state. Due to the magnitude of insured losses inflicted by Hurricane Andrew, the immediate post-storm reaction of several insurance companies was an attempt to reduce their underwriting exposure. Some of the factors that influenced such actions included: (a) the inability to obtain adequate reinsurance for new and existing risks in Florida, (b) the availability of new information from catastrophe risk models indicating that existing levels of exposure might be more significant than previously realized, (c) significant reductions in insurers’ policyholders surplus as a result of Hurricane Andrew, (d) concerns about rate adequacy, especially for coastal counties, and for certain classifications of risk such as condominiums, (e) “hidden” exposures resulting from potential assessments by various other mandated mechanisms (e.g., residual markets, catastrophe
funds, etc.), and (f) fear that an unfavorable catastrophe exposure would negatively impact the rating by agencies such as A. M. Best and Standard and Poors. Some initiatives had been implemented to alleviate these problems. An initiative proposed by the Florida Insurance Council (FIC) called for an agreement establishing post-hurricane cooperation between the FIC, the state insurance department, and state and local emergency management officials. In addition, the governor created a Building Codes Study Commission to evaluate the effectiveness of the building code system. Finally, the Florida Commission on Hurricane Loss Projection Methodology examined the role of computer models in determining insurance rates.

Keywords: insurance premiums, subsidies
Abstract: This report reviews the NFIP’s rating structure. One of NFIP’s goals is to generate a target level of premium income at least sufficient to cover expenses and losses relative to what is called the “historical average loss year.” The estimate of rates accommodates the portion of NFIP customers who pay less than full risk premiums (a subsidy provided by statute) and the portion that pay full risk premiums. In 2000, the distribution is anticipated to be 32 percent at subsidized rates and 68 percent at full-risk premium rates. FIA estimates that, were the catastrophic contingency contemplated in establishing all rate levels, the pre-FIRM subsidized portion of the business would have to pay about two-and-one-half times the current premium and the overall target level for premiums would have to increase on the order of 50 to 100 percent. The rate review also discusses generally accepted actuarial principles of ratemaking, overall rate level indications, target level premium analysis, rate review results, increased cost of compliance, expense constants, and the federal policy fee. The rate review indicates that written premiums based on all rate and rule changes through May 2000 are expected to be 118 percent of the level needed to fund the historical average loss year.

Keywords: awareness, NFIP
Abstract: This book acquaints the reader with the NFIP. It is designed for persons who do not need a detailed history or refined technical or legal explanations, but who do need a basic understanding of the program and the answers to some frequently asked questions. This book includes an introduction to the NFIP, flood insurance information for prospective buyers, information on coverage, and directions on how to complete a flood insurance claim. It also includes floodplain management requirements, flood hazard assessments and mapping requirements, important addresses, a phone directory, a list of available publications, and the address for obtaining the coordinator’s manual for the Community Rating System.

Keywords: lending institutions, mandatory purchase
Abstract: This book includes a brief description of the mandatory purchase requirement. It uses flowcharts, details coverage availability, and outlines general provisions of mandatory purchase. The book also discusses the specificities of condominiums, cooperatives, and timeshares and mentions key provisions, legal references, lender regulations, statutory provisions, notice requirements, NFIP resources, the standard flood hazard determination form, the waiting period for policy issuance, private flood insurance criteria, and key terms.

Keywords: easements, floodplain management, hydrology and hydraulics, structural approaches

Abstract: This article considers the possibility of utilizing the natural function of floodplains in conjunction with engineering works such as levees and dams. The extent of flood damage reduction achieved by allowing some floodplain areas to flood, its potential benefits and costs, and the locations and distribution of such benefits and costs, have not been studied in an organized way. While valuable theory and practice are available to compute the efficacy of using temporary storage of floodwater to decrease the downstream peaks, this theory has not been put to use in flood control policy. Furthermore, the technology to make field measurements is available. Finally, the article suggests that the purchase of easements for temporary flooding of some areas would decrease the amount of future disaster relief and would be a more permanent solution to some flood control needs.

Keywords: flood control, hydrology and hydraulics, public policy, riverine areas

Abstract: This book examines the controversial aspects of flood control in terms of the technical problems present in 1954. Starting with concrete knowledge about the hydrology of rivers and floods, the authors show the possibilities and limitations both of engineering structures and land management. They demonstrate that flooding can never be completely eliminated in a river system. The major part of the book analyzes the effectiveness of upstream and downstream programs for flood control, as advocated by the Department of Agriculture and the Army Corps of Engineers. In discussing general problems of policy, the authors present cogent arguments for redefining the federal interest in flood control and for apportioning the costs and benefits more logically both for the groups who need flood protection and for the nation. Lastly, the authors provide an assessment of flood control measures in 1954 and a lucid presentation of the hydrologic facts that have been overlooked.

Keywords: Connecticut River Valley, flood control

Abstract: This book considers the attempt to provide flood control in the Connecticut River Valley between 1927 and 1950 and outlines the conflicts that arose. The primary conflicts, which are thought of as microcosms of the political struggles of the period, occurred between the
federal and state governments over the best uses for the resources in the valley and between competing special interests over the allocation of those resources.

**Keywords:** legal issues and litigation, liability, Wyoming

**Abstract:** A federal district court jury in Cheyenne, WY, ruled that an act-of-God defense could not be used when a railroad culvert backed water onto residential properties during a catastrophic “10,000-year” rainstorm. The culvert capacity not only met, but also exceeded, industry design standards, yet the jury decided that the railroad was negligent for not installing a structure large enough to accommodate the “monster” storm. The 5-ft-diameter culvert, installed to replace a larger, deteriorating trestle, was sized by frequency-based methods to discharge the 50-year peak flow rate, with a nominal surcharge anticipated during the 1 percent annual chance event. Both sides agreed that the selected structure could have safely passed a more than 500-year event, but was not able to discharge all the flows from the freak storm. Backwater pooled 9 ft over the top of the culvert, flooding more than 20 basements in one subdivision. This paper reviews several matters debated during the trial and in subsequent analyses, presented as a case study from the writer’s perspective. The writer provided expert analysis for the defense, but was called to the stand as a witness for the plaintiff. The jury held the defendant liable for the damages and cited the defendant as negligent for not anticipating the storm and for failing to consider the risks to homeowners. Under court order, a large structure is to be installed. The article also discusses the implications for improvements in drainage design and expert testimony.

Available at: [http://www.ucowr.siu.edu/updates/pdf/V97_A10](http://www.ucowr.siu.edu/updates/pdf/V97_A10)

**Keywords:** cost-benefit analysis, floodplain management, public policy

**Abstract:** This article addresses the following issues included in the recommendations of *Sharing the Challenge*: (a) economically efficient flood risk management; (b) preservation and enhancement of the natural resources and functions of floodplains; (c) organization of floodplain management through the coordination of federal, state, and local agencies; (d) use of flood insurance to internalize the costs of floodplain development; and (e) the role of the federal government in floodplain management. Several implications about floodplain management follow from the general economic perspective presented. First, reducing expected flood damage should not be a goal of floodplain management per se; rather, the appropriate level of protection from flooding should equate the marginal social benefits of expected damage reduction with its marginal social cost. Second, over time, some flood losses are certain to occur, even under optimal policy. Third, the concept of the Standard Project Flood should have little or no place in floodplain management. Instead, the level of protection for every location should equate marginal social benefit with marginal social cost.

**Keywords:**
economic impacts, flood control, insurance, structural approaches, zoning

**Abstract:** This paper discusses and compares the economic effects of alternative programs for coping with flood losses (e.g., structural transformation of the river bed, which includes dams, levees, channel improvements, etc.; flood insurance; flood warning and evacuation systems; floodproofing; and flood zoning). The author argues that structural flood-control measures such as dams alter the stream flow so as to change the distribution function associated to flood losses. Thus, structural protection, by eliminating the smaller, more frequent floods that account for a large part of total flood losses, thereby reduces the expected value of losses. Floodproofing, flood warnings, and evacuation systems do not alter flood frequency but lower the level of flood damage associated with a given level of flooding. Flood insurance does not reduce the expected value of losses. Flood zoning may aim to reduce expected losses by affecting the pattern of development of the floodplain. However, the author states that it is very likely that in practice flood zoning will exclude some activities that could profitably locate in the floodplain. The author concludes that from an economic perspective, flood zoning is not a desirable method of coping with flood loses. Flood zoning could be justified only on the grounds that it is politically or administratively feasible, whereas other programs are not. Furthermore, flood insurance should be carefully considered as an integral part of any program for coping with flood losses. Finally, land-enhancement benefits, when properly measured, represent real gains that should be incorporated in benefit estimates.

Available at: [http://www.ucowr.siu.edu/updates/pdf/V95_A7.pdf](http://www.ucowr.siu.edu/updates/pdf/V95_A7.pdf)

**Keywords:** mapping, 1 percent annual chance flood standard, Special Flood Hazard Areas

**Abstract:** This article examines the NFIP’s one-percent standard. This standard, which describes an area with a one-percent probability of flood occurrence in any year, was established as the standard for defining Special Flood Hazard Areas (SFHAs) on FIRMs. The standard was useful for encouraging both community floodplain delineation studies and enrollment in the regular program. However, now that 85 percent of flood-prone communities are participating in the NFIP, the standard has become an obstacle to informed and efficient floodplain management programs. What was intended to be a politically acceptable minimum standard of protection has too frequently become the only standard. Along with the abolition of this standard, the article makes several recommendations for hydrologic and topographic studies, improved zoning, and the distinction between existing structures in the floodplain from prospective development in hazard zones.

**Keywords:** coastal areas, public policy

**Abstract:** This policy evaluation provides information about the development, alteration, or termination of coastal zone management programs. Such evaluation should involve the analysis of the extent to which an organization’s goals have been achieved. In policy evaluation, the critical design issue is to anticipate the policy context in which the evaluative information will be used. Anticipating the policy context involves responding to several questions. Who will make
policy decisions in regard to coastal zone management programs? What policy decisions need to be made? Do policy-makers require evaluative information to make these decisions? What types of evaluative information do they need? Can this information be provided in time to be used in the decision-making process? No single evaluative approach is likely to be appropriate for all situations because of the number of potential clients for such information and the variety of decisions that have to be made. Five general approaches are outlined: program logic, compliance, process, goal achievement, and impact assessment. The choice of a particular approach depends primarily on the issues faced by policy-makers. The choice of research design for policy-relevant evaluations of coastal zone management programs is affected by a host of factors. Two considerations are likely to be paramount, what types of policy decisions will the evaluations be used for? What are the stakes involved in the decision? The design and conduct of evaluative studies of coastal zone managements pose special problems. The causal analysis of the relationships among program interventions and coastal environmental conditions illustrates the research design problem. There are countless confounding factors that contribute to impacts on coastal resources. These factors represent rival explanations that can contribute to changing coastal conditions along with or instead of the program interventions. The ideal research design allows an evaluator to separate out spurious effects for true effects of the program intervention.

**Keywords:**
compliance, economic modeling, NFIP, Pennsylvania, socioeconomic impacts

**Abstract:** This study analyzes the NFIP from a sociological perspective. The research identifies those factors that influence the adoption of flood insurance regulations by studying all flood-prone municipalities in Pennsylvania. The study places emphasis on a community’s structural characteristics, typical patterns of response to previous issues, and past history with flooding. Through the use of multivariate analysis, the authors generate support for the utility of the field perspective of community action as an approach to the study of action. The study concludes with an interpretation and possible implementation of the findings.

**Keywords:**
public assistance, Scotland

**Abstract:** The article addresses the substantial costs of reinstatement – property assessment, planning, procurement, preliminary work, cost, and restoration – following flood disasters. It uses the experiences of district councils in Perth, Scotland in 1993 as justification for the consideration of a similar centralized source of expertise for flood damage and reinstatement work in the rest of Scotland. Estimates of damage from the January 1993 flood were £10 million, with more than 1,200 properties affected by floodwater. The body would advise property owners, local authorities, and insurance companies on appropriate technologies and strategies for effective and efficient flood disaster recovery.

**Keywords:** development, modeling, Oregon

**Abstract:** Flow trends and channel characteristics from 1936 to 1980 were evaluated for the Middle Fork of the Willamette River, which drains a 668-km² forested watershed in the Cascade Mountains of western Oregon. An inventory of aerial photographs from 1959 to 1972 shows that landslides associated with roads and in clearcuts were 27 and 23 times more frequent, respectively, than in forested areas. Numerous landslides unloaded sediments directly into the drainage system; most landslides appear to have been initiated during a large flood (return period greater than or equal to 100 years) of December 22, 1964. Analysis of precipitation and peak flows (greater than 100 m³ s⁻¹) from 1958 to 1980 by means of power function models suggests a trend of increasing flows as timber harvesting and road building expanded in the basin. Changes in channel pattern, documented from aerial photographs, show major increases in channel width from 1959 to 1967 and a trend of decreasing width from 1967 to 1980. During summer low flows in 1979 and 1980, 65 cross sections of the channel were surveyed to provide detailed measurements of existing channel conditions. Channel widths of 62 percent of the aggraded reaches were significantly greater (χ² = 0.05) than those for nonaggraded reaches.

**Keywords:** economic modeling, housing markets, insurance premiums

**Abstract:** This paper extends the option-price literature on uncertain housing characteristics to include insurance. The theoretical model predicts a relationship between housing price differentials and insurance premiums for housing located inside and outside of a hazard zone. The relationship is dependent on the consumer’s perception of the loss from hazard relative to reimbursement from an insurance company. The theory provides an exogenous test (the insurance premium) for using the hedonic method to measure willingness to pay for housing. The theory is tested using housing data inside and outside a flood hazard zone.

**Keywords:** Alabama, economic impacts, Florida, Hurricane Andrew, hurricanes

**Abstract:** The relative short time scale and limited spatial scales of hurricanes allow a normalization of damages at the present time. The most damaging hurricane in the period 1925-1995 was one that hit South Florida and the Alabama coast in 1926, following a path north of that followed by Hurricane Andrew in 1992. The normalized losses from the 1926 hurricane totaled $72 billion compared to the normalized $33 billion caused by Andrew. The most probable loss for a hurricane causing a loss greater than the 1926 hurricane is $152 billion. In constant current dollars, the average yearly loss from flooding in the United States is $3.1 billion
while losses exceeded $4 billion in 25 years. The largest yearly flood-related loss was from the Midwest floods of 1993, which caused a loss of $19.5 billion. The most probable value for yearly losses greater than that of 1993 is $32 billion.

Keywords:
Community Rating System, compliance, development, enforcement, federal programs, Flood Mitigation Assistance Program, floodplain management, Hazard Mitigation Grant Program, Maine, mapping, mitigation, NFIP, substantial damage, substantial improvement, variances

Abstract: Maine’s Floodplain Management Program provides information for communities interested in joining the NFIP, participating communities, homeowners, realtors and others in the form of technical information, floodplain maps, model ordinances, and workshops. Additionally, the floodplain management program reviews local ordinances for compliance with the NFIP. The handbook explains the NFIP’s floodplain regulations to those responsible for floodplain management in Maine. Chapter topics include model floodplain ordinances, floodplain data, activities regulated, preventing increased damages (the floodway and hazardous materials storage), protecting structures from flood damage, administrative procedures, and related important information (including the Community Rating System and FEMA’s Emergency Management Institute). Appendices include technical information, related publications and videos, floodplain management articles, the biennial report, and a glossary of terms.

Keywords:
compliance, mandatory purchase, NFIP, takings

Abstract: After passage of the Flood Disaster Protection Act in 1973, property owners in communities participating in the NFIP were required to purchase flood insurance to be eligible for any new or additional federal or federally financed assistance for any construction located in areas identified by HUD as having special flood hazards. All identified flood-prone communities must enter the program within one year after formal notification that they contain special flood hazard areas in order to qualify their citizens. To enter the program, communities must adopt and submit required land use controls that govern floodplain management and apply to all areas identified as flood plain areas having special flood hazards. However, such land use controls are not self-executing, they require the enactment of local ordinances for their implementation. This article offers a model ordinance by which communities can use as an example to craft their own legislation. In addition, the article offers background for better understanding the 1973 Act and the history of the NFIP. An analysis of the NFIP in its present form follows. Part three discusses the problem of regulation under the Flood Disaster Protection Act and whether implementing state and local legislation constitutes a taking of regulated property in violation of state and federal constitutional provisions. Finally, part four offers the model ordinance with commentary including citations of sources from which the various provisions of the model were developed.

Abstract: Nearly five million people in the United Kingdom are at risk of flooding. Annual average damage from flooding is estimated at £800 million. The report outlines current floodplain management policies and practices and examines how they can be improved. Annual investment in floodplain management is $400 million per year. While capital works investment increased by 50 percent between 2000 and 2004, government agencies recognize that a substantially higher level of investment is required to preserve current levels of protection. Moreover, in the past two decades, there has been an acknowledgement that structural mitigation can harm the environment, can exacerbate flooding in other areas, and can require costs out of proportion to the risks faced. Agencies have begun to incorporate nonstructural mitigation and whole watershed evaluation. The report recommends that investments in floodplain management utilize formal cost-benefit analysis and improve methods for the assessment of flood risk.

Abstract: Most real estate transactions involving a commercial lender include the lender’s determination of whether flood insurance is required for loan approval. Even if flood insurance is not required, standard loan documentation usually specifies the costs for flood insurance. This article examines the status of law on the issue of lender liability for failure to determine accurately whether a property requires flood insurance. The Fourth, Fifth, Seventh, and Eighth U.S. Circuit Courts of Appeals have held the National Flood Insurance Act (the Act) does not provide an express or implied federal statutory cause of action against a lending institution for violations of the Act. Yet, while federal courts have been unwilling to imply a private cause of action against lenders under federal law, they have not precluded lender liability under state common law. Some state courts have upheld the right of plaintiffs to file suit against a lender for failing to require flood insurance while others have refused to impose liability on the lender on the basis of principles of federalism. Based on actions in federal and state courts, a mere violation of the federal statutes will probably not create liability on the part of the lender for failing to require flood insurance or to notify the home purchaser of the presence of a floodplain. Thus, a client would be well-advised to insist on a flood letter in every real estate transaction.

Abstract: This book discusses the implementation of risk perception and floodplain management in a post-modern world. The papers feature examples of new approaches to managing flood risks in the United Kingdom, the Netherlands, Germany, and Bangladesh. Most important, the book tries to answer questions concerning 1) the role of technical, socioeconomic, and cultural conditions in science and policymaking; 2) the tools and methods necessary for effective risk and
floodplain management; and 3) the implementation of general concepts and ideas at the regional and local levels.

**Keywords:** awareness, Italy, Midwest floods of 1993, socioeconomic impacts

**Abstract:** The observation that similar types of natural disasters produce different reactions based on a particular culture and location demands a thorough and detailed analysis because the reasons are likely to be numerous and complex. Although the economic situation, political organization, and technological infrastructure of communities are fundamental factors, they do not offer a complete explanation of people’s behavior in the face of risk and disasters. This article uses a cross-cultural perspective to clarify the relationship between two cultures and their different patterns of response to extreme flood events. The research was carried out in the United States and Italy, both of which have similar socioeconomic characteristics, but distinctly different historical and cultural traditions. The disasters studied were the Po River Valley floods of November 1994 in northwest Italy and the Mississippi River-Missouri River floods in the upper Midwest of the United States during the summer of 1993. These two extreme floods were analyzed with respect to the pattern of human response during the preparation, rescue, recovery, and reconstruction phases. The study includes both human-response and cross-cultural analyses. A questionnaire was employed to gauge the perception of the flood disasters by the Italian and American disaster managers. The cross-cultural analysis was performed using an etic-emic contrast. The results show that the different human responses observed in the floods of northwestern Italy and of the United States Midwest were linked to basic differences in four cultural elements: 1) experience with floods, 2) sociopolitical traditions and organization, 3) level of integration within the community, and 4) perception of the physical environment.

**Keywords:** beach nourishment, coastal areas, environmental restoration, erosion, subsidies

**Abstract:** The president of the American Coastal Coalition states that beach erosion is not due to homes built near the coast but to the development of ports, inland waterways, and dams that interfere with the natural flow of sand. He questions the allegation that coastal property owners are subsidized by the rest of the nation, noting that NFIP premiums paid by residents of coastal states exceed their claims, and that funds spent to restore and protect coastal America pay off handsomely for all Americans. While unchecked erosion can leave coastal communities more prone to damage caused by storm surges, studies such as a National Research Council report from 1995 show that erosion is controllable by cost-effective, environmentally benign measures such as beach renourishment.

**Keywords:**
disaster assistance, federal programs, legislation

Abstract: This book examines the evolution of disaster relief policy, assesses problems with the current policy, and provides an understanding of the issues that are likely to be involved in future deliberations about federal policy. Three interrelated aspects of the history and politics of disaster relief are examined in the book. The first is legislative history, involving considerable change in disaster relief legislation, congressional politics, and normative aspects of the federal role in providing assistance. A second aspect of the history of disaster relief policy examined is organizational history, as it mainly relates to repeated internal reorganizations of the disaster relief function in the executive branch. Finally, there is the history of what actually happened in the field in the aftermath of disasters concerning relationships among federal, state, and local officials. The book analyzes the way in which negotiations over disaster-specific relief provisions shape overall policy.

Keywords: mitigation, relocation, Wisconsin

Abstract: The authors compared the cost of relocating the business district of Soldiers Grove, WI, from its original site with cost estimates for raising traditional flood protection structures. The authors concluded that the town’s choice (relocation) was the correct one. The authors reached their conclusion, despite almost identical cost estimates for both alternatives, because of the implied modernization of the town and the environmental consequences that the traditional measures could have caused (these measures were coupled with a never-completed dam). The authors acknowledge that relocation may not be desirable or easy for larger communities.

Keywords: endangered species, environmental policy, Washington

Abstract: The article discusses recent actions by environmentalists to sue the federal government for harm to salmon protected under the Endangered Species Act. The lawsuit addresses the negative effects of development on the salmon population. The author states that development creates more impervious surfaces that increase runoff during floods, increases the deposit of pollutants into streams, and concentrates water into fewer, faster-flowing channels. In the past, FEMA officials have argued that issuing flood insurance has such a limited effect on development that they are not required to consult on the effect on protected fish. If successful, the suit would compel FEMA to check with federal fisheries officials before offering government-backed flood insurance in SFHAs near streams. In the author’s opinion, the proposed action could affect tens of thousands of acres and set a precedent for much of the western United States.

Keywords:
environmental restoration, floodplain management

Abstract: The author contends that until recently, federal policy encouraged and funded major flood-control projects, and thus contributed to the loss and degradation of resources from the nation’s floodplain. However in recent years, floodplain lands and waters have been recognized as ecologically productive, hydrologically important, and environmentally sensitive. Following the Midwest floods of 1993, the Federal Interagency Floodplain Management Task Force revised the Unified National Program for Floodplain Management to reflect the increased recognition of the importance of protecting and restoring the natural resources and functions of floodplains, as well as reducing the loss of life and property caused by floods. During that same time, the Executive Office of the President established the Floodplain Management Review Committee. The Committee prepared a report, *Sharing the Challenge: Floodplain Management Into the 21st Century*, which reinforced the findings of the Task Force. The author affirms his support for a *Floodplain Management Action Plan* for the nation.

**Keywords:**
building codes, Community Rating System, compliance, development, enforcement, federal programs, floodplain management, mapping, Michigan, mitigation, NFIP, substantial damage, substantial improvement, variances

**Abstract:** Successful floodplain management depends on proper building construction in areas subject to flooding. This handbook is a tool for building inspectors, zoning administrators, and other floodplain managers to help guide construction in flood-prone areas and to meet the requirements of the NFIP, Michigan statutes, and local zoning and building codes. Chapter topics include building codes and permit coordination, plan review for the reduction of flood hazards, building inspectors’ duties, flood-hazard construction techniques, developments requiring special attention, variance criteria of the NFIP, the Community Rating System, and making changes in flood hazard maps.

**Keywords:**
Australia, dams, flood causes, riverine areas

**Abstract:** This report analyzes the flood risk associated with heavy rainfall and dam failure in Southeast Queensland. River flooding associated with heavy rainfall can be caused by a number of different factors. As a result, no two floods in the same catchment are ever identical. Using designs of flood events and historical rainfall and flood level information to examine flood risk and impact, the authors examine areas that suffer a high risk of floods due to heavy rainfall. They try to identify areas with particularly high flood risk and examine the flood risks due to potential dam breaks in these areas. The authors also use analysis of past flood experiences to provide potential insights into future incidences of flooding.

**Keywords:** awareness, risk communication

**Abstract:** This paper synthesizes the social psychological process that explains how members of the public receive, process, and eventually come to take protective actions in response to the receipt of warnings of extreme floods. The author argues that effective public warnings must provide for public interaction and foster the search for information in addition to received warnings. Furthermore, according to the author, communicating risk to the public is an almost continual process when viewed globally.

**Keywords:** mitigation, public policy

**Abstract:** *Disaster by Design* is aimed at a general audience, including policymakers and practitioners. It synthesizes statements about hazards and human coping strategies. This book stemmed from the second national assessment on natural and related technological hazards and disasters and it contends that many disaster losses are the predictable result of interactions among three major systems: the physical environment; the social and demographic environments; and the buildings, roads, bridges, and other components of the constructed environment. Settlement of hazardous areas has destroyed local ecosystems that could have provided protection from floods and other natural perils (e.g., the draining of swamps in Florida). Furthermore, mitigation efforts themselves can degrade the environment and contribute to the next disaster (e.g., levees built to provide flood protection can destroy riparian habitat and heighten downstream floods) and some efforts to head off damages from natural hazards only postpone them (e.g., dams or levees). The book suggests six objectives for sustainable mitigation of hazard risks: (a) maintain and enhance environmental quality, (b) maintain and enhance people’s quality of life, (c) foster local resiliency and responsibility, (d) recognize that vibrant local economies are essential, (e) ensure inter- and intra-generational equity, and (f) adopt local consensus building. The book concludes that in order to support sustainable hazard mitigation, researchers and practitioners need to ask new questions as well as continue to investigate traditional topics. Important efforts will include interdisciplinary research and education, and the development of local hazard assessments, computer-generated decision-making aids, and holistic government policies. Future work must also focus on techniques for enlisting public and governmental support for making sustainable hazard mitigation a fundamental social value. Members of the hazards community will play a critical role in initiating the urgently needed nationwide conversation on attaining that goal.

**Keywords:** development, liability, NFIP
Abstract: The author forecasts that the NFIP is going to be one of the biggest domestic liabilities in the United States. Scientists at the National Hurricane Center predict that another storm cycle of “super hurricanes” would mean claims of $3.5 billion to $4 billion. The National Flood Insurance Fund has less than $400 million, so any shortfall would have to be paid by the federal taxpayer. The author claims that the NFIP was originally intended to discourage overdevelopment of coastal areas, but it resulted in an explosion of coastal development in the 1970s and 1980s. Congress attempted to overhaul the NFIP in 1992 but, according to the author, a coalition of powerful interest groups fought against it, and the legislation did not pass.

Keywords: agency operations and management, floodplain management, nonstructural approaches, structural approaches, Tennessee Valley Authority

Abstract: Increasing attention has been focused on the need for a more comprehensive approach to flood management that combines traditional structural approaches with elements of nonstructural floodplain management. For the past 50 years, the Tennessee Valley Authority (TVA) has met its responsibilities for flood control in the Tennessee River Basin through such a dual approach, combining a system of multipurpose dams and reservoirs with a floodplain management program to encourage appropriate shoreline development. This article provides an overview of TVA’s floodplain management program including a description of the hydrologic conditions in the region, an overview of the reservoir system and its flood control capabilities, and a description of forecasting procedures and flood control operating strategy. The development and implementation of TVA’s floodplain management program, and its role in reducing flood damages in the Tennessee Valley are also presented. The article closes with a discussion of the role of technological advances and agency streamlining of future operations.

Keywords: coastal areas, development, Rhode Island

Abstract: The predominant force influencing sales and development of beach properties in Westerly, Charlestown, and South Kingston, RI, is the availability of direct financing of such properties as a result of the availability of flood insurance. Bankers and realtors agree that the availability of flood insurance has created a broader base of property owners, particularly among middle income individuals who can now afford beach properties because of direct financing available up to 70 percent of the property value. There is a definite cause-and-effect relationship between flood insurance and available direct financing and a less definite relationship between accelerated sales and flood insurance. The low cost of flood insurance is both affordable and negligible when compared with the risks involved and the protection afforded property owners. Flood insurance premiums in the early 1970s did not act as economic disincentives to development on the barrier beaches of the three towns.

**Keywords:**
coastal areas, development, floodplain management, Rhode Island

**Abstract:** In this study of three communities, the author says that local banks voluntarily withdrew from the first mortgage market due to hurricane destruction in 1938 and 1954. Building, however, continued during this period since homeowners were able to get mortgages from lenders outside the local market. Once flood insurance was available to secure mortgages, however, local banks again began to issue mortgages on ocean front property. Because the demand for coastal property was high before enactment of the NFIP, the author argues that there was no clear evidence that the availability of flood insurance increased that demand. The author claims that most property owners in the area perceive flood insurance as a bonus. The author contends that some evidence implies the availability of flood insurance in coastal areas may work as a counter force against sound coastal management, by sustaining and even increasing property values.

**Keywords:**
development, property values, Rhode Island

**Abstract:** This research was an attempt to test whether the findings in Miller’s 1975 study of Rhode Island could be applied to the nation as a whole. The author chronicled a tremendous growth in coastal development in the 1960s and 1970s but the demand generally existed before the NFIP. The author concludes that: (a) adding the cost of insurance premiums to the property apparently neither increases nor decreases demand for coastal properties; (b) there was no evidence that floodplain management requirements on coastal development depressed demand for coastal property; (c) the greatest effect on property values during this period wasn’t the NFIP but rather market forces; and (d) in most coastal communities, the NFIP had not affected the basic investment decision on availability of financing.

Available for purchase at: [http://www.floods.org/PDF/PUBSLIST.pdf](http://www.floods.org/PDF/PUBSLIST.pdf)

**Keywords:**
coastal areas, development, subsidies

**Abstract:** The author contends that federal subsidies for infrastructure and disaster assistance have played a significant role in coastal development since the end of the Korean War. In most cases, according to the author, flood insurance was not the main force behind such development. Subsidies for bridge access, roads, water supplies, water treatment, and wastewater treatment had a more profound impact on development.

Keywords: attitudes, awareness, coastal areas, relocation, Upton-Jones Amendment

Abstract: The author uses data from two coastal communities to explain why the relocation provisions of the Upton-Jones Amendment are used infrequently. Interviews and other analysis of the two communities led him to conclude that owners generally buy oceanfront property with knowledge of the risk and of the history of storms and other hazards in the area. People buy on the oceanfront because they “want to be there,” find their risk acceptable, and often would locate there regardless of whether flood and wind insurance were available. Besides, coastal property owners are far more likely than their riverine counterparts to rebuild in the same location if a disaster destroys their home. Each of the owners that Miller interviewed carried high amounts of flood, wind, and homeowners insurance. All said they realized they might lose their investment to erosion but felt the possibility a small one. Retreating from the water’s edge, even with some government subsidy, was not economical for most of the owners since they enjoyed a good secondary income by renting the ocean front property to seasonal visitors. For many, rental incomes, even when offset with the cost of insurance and repairs, made the property a good personal investment. The amenities of an oceanfront location—view, beach access, water recreation, nearby wetlands, and general peace and quiet—seem to meet deeply felt emotional needs of people who own property there.

Keywords: floodplain management, Midwest floods of 1993, mitigation

Abstract: This book draws on recent case examples and aims to provide authoritative scientific and technical information. It includes flood statistics; information on the Midwest floods of 1993; causes of floods; floodplain management, strategies for reducing loss of life and property; floodplain mapping; flood insurance; structural counter measures (e.g., dikes, flood control reservoirs, flood detention basins, and river training); nonstructural defenses (e.g., floodproofing, soil and water conservation, flood forecasting; and dam safety); and emergency responses (e.g., flood precautions, post-flood recovery, and post-flood review).

Available at: [http://www.publications.parliament.uk/pa/cm199798/cmselect/cmagric/1117/111703.htm](http://www.publications.parliament.uk/pa/cm199798/cmselect/cmagric/1117/111703.htm)

Keywords: England, floodplain management, public policy

Abstract: Following the 1998 floods in England, the Agriculture Committee issued a report entitled *Flood and Coastal Defence*. In response to that report, the Ministry of Agriculture, Fisheries and Food and the Environment Agency issued a report entitled *Fifth Special Report: Government Response to the Agriculture Select Committee Report on Flood and Coastal Defence*. In this report, the government makes a number of recommendations regarding improvements to national flood management policy and urges national policymakers to “embrace more holistic management of [England’s] river systems and coastlines.”

**Keywords:** buyouts, Hazard Mitigation Grant Program, Minnesota, mitigation

**Abstract:** Since 1988, the Division of Emergency Management through FEMA’s Hazard Mitigation Grant Program (HMGP) has committed more than $70 million to reduce future damages caused by natural disasters. This report explains some of the mitigation successes the state has recognized in recent years. Successes include a program to buyout flood-prone homes in Austin, an initiative to strengthen an electric cooperative against extreme weather in Mankato, and a project to create disaster-resistant manufactured homes in Owatonna.

**Keywords:** buyouts, Missouri, mitigation, relocation

**Abstract:** This report illustrates the success of the Missouri Buyout Program (MBP) and offers sufficient in-depth background for a public policy debate on continued funding of such programs. The MBP is a proactive and cost-effective program that stresses a collaborative effort among federal, state, and local governments. It is a voluntary program, providing residents a practical solution by relocating homes outside of the floodplain. Once the properties are cleared, the publicly owned land may then be used for purposes more consistent with the threat of repeat flooding (e.g., open space). The following recommendations are included in the report: establish a buyout and hazard mitigation program with funding authorities independent of disaster declarations; maintain flexibility in hazard mitigation programs to promote cost-effective and appropriate mitigation techniques, include the option of states receiving funds as a block grant; and develop common procedures for federal buyout and mitigation programs.

**Keywords:** buyouts, cost-benefit analysis, mitigation, socioeconomic impacts, structural approaches

**Abstract:** The federal government has pursued both structural and nonstructural solutions to disastrous floods. The cost-benefit analyses that drive the choices of mitigation solutions, however, do not fully account for the social impacts of each decision. The NFIP’s buyout plan aims to remove at-risk structures within the floodplain, but the social consequences of this plan have not been studied. Consequences may include changes to the core urban structure, loss of farmlands, and loss of passive recreation areas. Ultimately, these decisions favor those with money over those without. Even voluntary buyouts give the property owner poor choices: move out of one’s home or stay and have the surrounding areas gradually reduced in economic and social value. This disproportionately affects those already living on the economic margin.

Keywords:
awareness, building codes, buyouts, Flint River Basin, Georgia, relocation, substantial damage

Abstract: This book, based on research funded by the FEMA and ASFPM, assesses federal, state, and local flood loss reduction efforts in the context of Georgia’s floods of 1994. The study finds that federal, state, and local governments worked successfully at implementing policies and programs to reduce future flood losses. Reasons for the positive outcome include the implementation and enforcement of preexisting federal recovery and mitigation policies; Georgia’s adoption of the federal policies as the main elements in its recovery plan and subsequent efforts to establish state guidelines for acceptable local recovery plans; and the state’s provision of trained local building inspectors to ensure the implementation and enforcement of state building codes. The book makes several other findings. First, FEMA’s buyout and relocation policy is too limited and inflexible to accommodate complex local issues like those that arose in Albany, GA, such as a failure to coordinate local and regional programs and a flawed method for determining buildings that were substantially damaged. Second, flood insurance was not widely purchased by property owners in the Flint River Basin. Those who purchased coverage tended to be underinsured, and disaster assistance was the primary source of federal funds to individual victims. Third, federal, state, and local officials made sub-optimal decisions because they did not share important data or effectively use data collected by others.

Keywords:
development, housing markets, property values

Abstract: The author asked a local sample of diffusion agents (defined as mortgage lenders, real estate agents, and property insurance agents) a variety of questions about their interaction with consumers who had purchased or were considering purchasing property in flood hazard areas. One of the questions was whether the agents felt the NFIP and local floodplain regulations made a difference in the demand for land in the floodplain. Generally, those who responded felt there was little or no effect of the NFIP on the local housing market. In other words, it neither decreased nor increased demand. They reported that when consumers first learned that a piece of property was in the hazard area, it seemed to concern them but ultimately did not deter them from their purchase decision. The extent to which their decision to purchase was related to the comfort afforded by insurance availability is not clear from these findings.

Keywords:
floodplain designation, housing markets, New York, Pennsylvania

Abstract: This study presents the effect of floodplain designation on the residential real estate market in Elmira, NY, and Wilkes-Barre, PA. Discriminant analysis differentiates between floodplain and nonfloodplain housing, using as independent variables characteristics of the houses sold. Several variables define submarkets, but they vary between the communities. Only selling price and lot size were significant for both communities. Distinct floodplain and nonfloodplain housing markets can be differentiated. This allows for isolation of socioeconomic
and environmental variables that can contribute to the recovery of housing values following flooding or to the implementation of land-use controls associated with floodplain designation.

*Keywords:* compliance, development, floodplain management, urban areas

*Abstract:* In 1958, researchers from the University of Chicago documented increases in the number of structures in the floodplains of 17 American cities, a phenomenon attributed to the prevalence of flood control structures. Because federal policies have shifted to managing floodplains, this paper updates the 1958 study for nine of the cities. Several trends are apparent. Development pressures determine floodplain encroachment; floodplain management regulations have been implemented where it was easiest to do so. Further, structural measures continue to dominate. Thus, while many local officials are becoming more aware of advantages of floodplain regulation, implementation and enforcement are inconsistent and uneven.

*Keywords:* California, economic modeling, housing markets, property values

*Abstract:* A case study of two communities in California that flooded following a levee break represents a relationship between residential property values and the incidence of flooding. Analysis of the real estate market before and after the flood shows that the flood was capitalized into housing values, whereby both list and selling prices dropped immediately but have recently begun to recover. However, recovery of the market is not uniform throughout the floodplain. Houses that suffered from 18 inches of water recovered to near preflood values in less than one year. In contrast, houses that had approximately 10 feet of water in them have not recovered to the same extent, indicating that capitalization and recovery do not occur evenly. These findings suggest that policies and programs should address these spatial and temporal differences in recovery, which are expected to vary with different flood frequencies and magnitudes.

*Keywords:* cost-benefit analysis, development, Florida, New York, NFIP, property values

*Abstract:* This study is based on a research design developed by Newton, Myers, and Monday (1996), which posed three questions related to floodplain activities over the last 30 years: (a) What has been the NFIP’s effect on human occupancy of floodplains?, (b) What has been the effect of the NFIP on net economic value of floodplain occupancy?, and (c) What has been the NFIP’s effect on the natural functions of watersheds? This two-city pilot project was aimed at obtaining a preliminary view of the impacts of NFIP and at refining a methodology for a broader national assessment. The results reported focus on the first two questions. The results suggest differences in occupancy and economic value of floodplain and nonfloodplain areas since communities joined the NFIP. Some differences can be attributed to economic and demographic
characteristics, but others cannot. With all but multiple-family residences, there is a tendency toward decreased investment in floodplains, but patterns differ between the two cities. In Syracuse, a decrease in the number of structures was evident, except with multiple family residences. In Tampa, there were increases in all floodplain land uses, but the absolute change in number of structures was higher in the nonfloodplain area. Thus, even with growth, there is a tendency toward less economic activity in the floodplain. The timing of this differs between cities. In Syracuse, joining the NFIP coincided with a decrease in the number of structures, whereas in Tampa, the greatest increase in number of structures in the floodplain occurred at this time. While these changes could have come about before entrance into the NFIP, the pace of investment decreased in the floodplain as community experience with the NFIP increased, and this differs from nonfloodplain areas. It is clear, therefore, that these results are not removed from other forces that affect investment in development. In Syracuse, the study period includes times of economic downturn; decreases in the number of structures could be attributable to that condition. However, if that were the case, the differences between floodplain and nonfloodplain areas would probably not exist. It appears that the NFIP is making a difference, irrespective of the socioeconomic characteristics of communities.

**Keywords**: Army Corps of Engineers, federal programs, floodplain management

**Abstract**: This study examines the relationship between the Army Corps of Engineers and the development of federal programs of floodplain management. While the narrative primarily focuses on the Corps, any study of floodplain management must embrace many subjects. The decisive players in the theory and practice of flood damage abatement include the evolution of associated engineering technologies; political, social, and economic impacts on the enactment of legislation; the workings of the political process; the organizational impulses directing agency decisions and practices; and changes in public opinion.

**Keywords**: Army Corps of Engineers, beach nourishment, development, erosion

**Abstract**: Coastal states and towns say that beach replenishment is vital to attract tourists, to protect coastal property from storms, and to drive economies. Environmentalists, however, oppose beach replenishment, saying it does not last, is environmentally questionable, and is bad fiscal policy. The federal government, which pays for 65 percent of beach replenishment through the Army Corps of Engineers, wants to cut back. Opponents of beach replenishment argue that federal subsidies should not pay to protect coastal properties. Environmentalists oppose building seawalls to protect beachfront property and building groins and jetties to try to hold beaches in place. They say the real villain in erosion is development and recommend moving buildings back from the oceanfront. Since 1965, an estimated $3.5 billion has been spent on beach replacements according to a study by Duke University’s Program for the Study of Developed Shorelines. The Army Corps of Engineers cites much lower numbers but says it is spending $150 million a year on beach replacement. The Clinton Administration proposed cutting these funds in the Water Resources Development Act; it would pay for 65 percent of the initial cost but only 35 percent
for the following 50 years of maintenance. With federal budget cuts, coastal communities would face tough decisions on whether they can or want to pay more of the bill. Local decisions in five states are described.

Abstract: FEMA provided funding for this report and asked the American Planning Association (APA) to write and publish it as a form of outreach to the planning community. The report advocates an approach to residential subdivision design in flood hazard areas that uses the full range of available land-use planning techniques to reduce flood damages and minimize impacts on floodplains. It recognizes the dual goals of the Congress, FEMA, and many state and local governments to reduce the loss of life and property caused by floods and to protect and restore the natural resources of floodplains. Chapter 1 offers an overview of the environmental and policy context in which floodplain management and subdivision planning, regulation, and design takes place. It also describes the legal and constitutional framework for subdivision regulation and floodplain management. Chapter 2 addresses the natural functions of the floodplain and describes the range of tools that are available to protect these functions. Chapter 3 describes fundamental land-use planning activities—comprehensive planning, zoning, and subdivision control—and their relationship to floodplain management. It also describes other techniques that have been used to protect floodplains such as cluster development, transferable development rights, greenways, and setbacks. Finally, Chapter 4 provides a detailed description of site design and planning techniques to protect properties from flooding and to preserve the natural functions of floodplains. A design hierarchy is presented that recommends four approaches to subdivision development in or near floodplains. Additional detail on how NFIP requirements and CRS activities are related to land-use and site planning are also provided in Chapters 3 and 4.

Keywords: Canada, disaster planning, Manitoba, Red River, risk communication, risk management, socioeconomic impacts

Abstract: Prepared at the request of the International Joint Commission’s Red River Basin Task Force, this report aims to assess the problems encountered by individuals and communities in coping with the 1997 flood. The report also presents a series of recommendations on how to plan more effectively to reduce human hardship in subsequent floods. Victims themselves provided information for the report. Fifty-four victims participated in interviews in several different communities both within Winnipeg and in surrounding rural areas. Interviewees answered questions on how the flood impacted them, their families, and their communities. In addition to a wide range of closed questions, many open-ended questions asked during the interviews permitted victims to better describe their perceptions and experiences. The authors analyzed qualitative and quantitative data from the interviews to identify the most prevalent and serious
problems faced by victims. Based on the analysis, the report makes the following recommendations: develop a public information system using state-of-the-art technology, develop a comprehensive flood management plan involving all levels of government and local communities, improve flood warning and evacuation systems, identify local communities’ resource requirements and develop mobilization plans to get resources, and reorganize the claims process of the (Manitoba) Emergency Measures Organization.

**Keywords:** flood insurance rate maps, FIRMs, DFIRMs  
**Abstract:** In 1999, FEMA announced it expected the conversion of flood insurance rate maps from paper to digital format would be complete by 2008. Many local governmental entities became concerned at this deadline because they do not have the equipment or the expertise to create the digital data needed to create DFIRMs. Also, property owners became concerned that the flood hazard boundaries may change on DFIRMs, because DFIRMs are supposed to be more accurate. The transfer of FEMA to the new Department of Homeland Security also caused concern to some homeowners who feared that privacy rights might be affected by aerial and ground data collection efforts for the DFIRM project.

**Keywords:** floodplain management, mapping, modeling, risk assessment  
**Abstract:** Flood frequency and risk analysis play a fundamental role in the insurance, floodplain management, and hazard mapping aspects of the NFIP. The analytic procedures commonly utilized in flood insurance studies of riverine floodplains include flood frequency analysis for gauged and nongauged streams and stage-frequency determinations. Coastal flood insurance studies include synthetic storm surge modeling, statistical analyses, and wave analyses. Consistency in flood frequency estimates over both time and space is needed to effectively administer the NFIP at the national and local levels. Enhanced capability in risk analysis for ice jams, erosion, levee failure, shifting channels, long-term lake level fluctuations, and mudflows is also needed to support the program’s operations in these specialized hazard environments.

**Keywords:** flood hazard mitigation; Community Rating System, minimum building standards, NFIP  
**Abstract:** This article presents an historical perspective on federal involvement with flood control and discusses basic concepts of the NFIP including its objectives, community participation and mitigation, flood hazard identification and risk assessment, the availability of insurance, and future directions for the program. Aside from conventional information on the program’s operations, the article notes some current assessments undertaken by FEMA including
a major effort to evaluate the effectiveness of floodplain management standards. According to
the agency, experience as of the end of fiscal year 1987 indicates the adequacy of the NFIP’s
minimal building standards. Plans for future activities include increased monitoring of
community compliance with minimum criteria of the floodplain management program,
integration of geographic information systems (GIS) into mapping techniques, creation of new
products and services for users of flood-hazard data, and improved capabilities to analyze unique
flood-related hazards. Finally, the article describes a framework for a community rating system.

**Keywords:**
development, mitigation, Oregon, property values

**Abstract:** Ambiguities about the relationship between floodplain regulations and residential land
values in Oregon were investigated. Clarification of this relationship should facilitate the long-
delayed implementation of a more comprehensive and successful approach to flood hazard
mitigation than is presently employed. The suggestion that current floodplain regulations
significantly depress appreciation rates of regulated lands relative to those of similar unregulated
lands was rejected in most cases. When this suggestion was accepted, the circumstances rendered
the conclusions tenuous. Problems and issues facing this type of research are presented in case
studies of two of the research study areas. However, conclusions should remain tentative because
the research could not be carried out under ideal conditions. The criteria for establishing uniform
study areas could not be fully met, even though much attention was paid to this step in the
research process. One problem is that considerable development had taken place in some of the
study areas prior to the implementation of floodplain regulations. Under these conditions, a valid
question regarding the relation between regulation and land values appears to be whether any
possible negative aspects of land-use regulations are not outweighed by the positive attributes of
flood insurance, which becomes available concurrent with the local adoption of regulations.

Mueller, R.H. (1988). Feasibility of predicting 100-year floodway width and depth in the
Tennessee Valley by multiple linear regression. In *Floodplain Harmony, 6*. Boulder, CO:
Natural Hazards Research and Applications Information Center, Institute of Behavioral
Science, University of Colorado.

**Keywords:**
modeling, Tennessee Valley Authority

**Abstract:** One of the most serious impediments to effective administration of local flood damage
reduction programs cited by community officials and state NFIP coordinating agencies is the
lack of detailed flood data (i.e., flood depth and floodway width). The Tennessee Valley
Authority (TVA) is making an effort to develop equations for estimating flood depth and
floodway width along natural, unobstructed stream reaches from common watershed
characteristics using multiple linear regression. Results show that floodway width cannot be
predicted with reasonable accuracy because of the inherent variability of floodway width along a
given stream reach. The U.S. Geological Survey (USGS) and several state agencies have had
success developing regional equations for predicting 1 percent annual chance flood depths.
Depth regression equations adequately cover most of the Tennessee Valley. The inherent
variability of floodway width discourages use of regional regression equations for predicting it.
The need for an easy-to-use method for predicting floodway width remains.

coastal areas, cost-benefit analysis, economic impacts, economic modeling, hurricanes, mitigation, natural disasters, nonstructural approaches, public policy, relocation, risk assessment, riverine areas, structural approaches, wind

**Abstract:** This report establishes the parameters for a study, but does not include results from the study itself. Report 106-161 for the Fiscal Year 2000 House Appropriations Committee, Subcommittee for the Veterans Administration, Department of Housing and Urban Development, and Independent Agencies mandated that FEMA “fund an independent study to assess the future savings resulting from various types of mitigation activities” to determine which mitigation activities actually lead to savings. FEMA gave the assignment of defining the parameters of the study to the Multihazard Mitigation Council (MMC) of the National Institute of Building Sciences. The MMC convened a panel of experts who conferred with a variety of stakeholders to set the parameters for the study. The panel proposes two studies on representative mitigation activities and communities. Track A examines mitigation activities in varying contexts in a representative national sample of mitigation activities. Track B examines mitigation activities in specific community contexts in sample chosen to maximize variations in hazards and mitigation activities considered. In both studies empirical research will be used to examine savings resulting from the mitigation activities employed and will allow for generalizations to the nation as a whole.

agency operations and management, communication, England, floodplain management, public policy, risk management, strategic planning.

**Abstract:** The document contains the Strategy for Flood Risk Management, which describes what the Environment Agency (EA) and its Flood Defense Committee intend to do to reduce flood risk over the five-year period between 2003 and 2007. The plan sets performance targets for three years and five years and priorities for improvements in floodplain management. Within the first three years of implementation, EA intends to have no loss of life as a result of flooding and reduce the risk of flooding to life, major infrastructure, homes, and environmental assets. By 2007, EA intends to improve the coverage of flood warning services to 77 percent of properties in flood-risk areas, reduce the percentage of properties in high-risk flood areas, and prevent all inappropriate development within floodplains. The principal methods of achieving these goals are to adopt a strategic planning approach to floodplain management, prevent inappropriate development, emphasis effective communications, and utilize resources efficiently. The report recognizes that through a combination of reducing the probability of flooding and the impact of flooding, flood risk can be reduced, but not eliminated.

history, 1 percent annual chance flood standard, public policy

**Abstract:** This paper reviews the rationale behind the creation of the NFIP, describes the purposes of the program and how it operates at the community level, highlights issues of concern that would impact effectiveness, and recommends research to improve the NFIP’s ability to reduce vulnerability to flood damages. Prior to the introduction of the NFIP, a structural approach — levees, dams, reservoirs — was favored for dealing with flooding. The NFIP marked a major departure from past policy. Though the paper acknowledges many of the successes of the NFIP, it highlights several areas of concern to the program’s effectiveness. First, minimum building standards allow for some flooding. Full development of the floodplain in line with NFIP regulations could result in substantial flood damage to properties. Second, the use of the 100-year standard (1 percent annual chance of flooding) has lead to the widespread belief that a building protected from the 1 percent chance flood or outside the SFHA is “safe.” Third, financial and lending institutions have not been conscientious in ensuring property owners maintain flood insurance as a condition of their loan. As a result, only 25 to 30 percent of buildings located in SFHAs have proper insurance coverage. Fourth, the public has high expectations for the federal government’s ability to provide disaster relief, discouraging individuals and state and local governments from preparing for, responding to, or recovering from disasters. Myers recognizes that the NFIP has taken promising steps to achieving its goals, including the CRS and recent amendments to the NFIP and disaster relief laws. In terms of research needs for the improvement of the NFIP, Myers cites such basic data as the cost of disasters and disaster relief, and the cost and benefit of various mitigation strategies. She also states that floodplain research should be cited in the broader context of natural resource management.

floodplain management, levees, Midwest floods of 1993, Mississippi River

**Abstract:** This article discusses the federal government’s participation in flood management since 1825; the flooding in the upper Mississippi and lower Missouri basins from mid June through early August 1993; the impact of the flood on urban and rural families; the dilemma of whether to repair or rebuild damaged buildings and levees; new recognition of the values of floodplain management; and the need to include the idea of mitigation in the disaster cycle of preparedness, response, and recovery. It questions why so many levees failed. Sidebars list recommendations for floodplain management and significant events in the development of U.S. flood control policy. Charts depict the area’s weather and water flow patterns and a table presents preliminary estimates of damage to levees in the Mississippi River Basin in 1993.

Abstract: This report analyzes the NFIP’s operating results. It first attempts to correct a widespread misconception about the NFIP, namely, that FIA gives taxpayer money to flood victims. Second, statutory background is examined concerning the concepts of moral hazard and adverse selection. Moral hazard is inherent in any insurance, and therefore must be accepted as a matter of degree. Third, financial analysis shows that post-FIRM policyholders living below BFE have been overpaying and both pre-FIRM and post-FIRM policyholders living above BFE have been underpaying. Thus, the problem arises of an internal transfer, or premium subsidy, within the NFIP. Fourth, two implications from this internal transfer problem are discussed. One is that the map modernization project needs much more attention. The other is that the lowest floor elevation information for pre-FIRM properties must be attained to determine the policyholder’s premium, thus taking potential losses from a catastrophic year into consideration and making this group of policyholders financially self-sufficient. Last, splitting NFIP policyholders into two groups, those with actuarially based policies and those with policies based on historical averages, is suggested. The split would set post-FIRM policyholders who are living below BFE free from the burden of overpaying premiums, and would more appropriately place this burden on those with historical average flood insurance, leading to a substantial premium hike. The only way out for those policyholders, under the participation requirement mentioned above, is to get elevation certificates, to conduct a thorough flood study, and to join actuarially based flood insurance. In the historical average method, people with less than average risk are forced to pay more than their fair share; by getting elevation certificates, they would move to an actuarially based program. This rationale leads to an elimination of historical average insurance and introduces flood mitigation loans based on risk information. Without information on lowest floor elevation and major leverage for map modernization, flood-related programs cannot achieve their goals.

Keywords: disaster planning, legal issues and litigation, public policy, strategic planning

Abstract: In November 1997, a high-level Disaster Information Task Force consisting of federal officials from several key agencies submitted to the vice president a report that recommended the federal government begin to create an electronic disaster information network for the nation that could become a leading component of a worldwide Global Disaster Information Network (GDIN). Under a cooperative agreement with the U.S. Geological Survey, the National Academy of Public Administration undertook a preliminary analysis of certain legal limitations on access to and disclosure of disaster management data within the United States that will be important to consider in developing a national component of the GDIN. The legal limitations involve intellectual property, privacy, liability, and security concerns. This summary report presents the findings and recommendations of the analysis. For example, the Academy found that the current array of federal, state, and local laws, regulations, and practices that limit data access and disclosure is highly complex, and the many separate provisions are not always consistent and
often conflict with each other. The Academy recommends that a disaster information network incorporate a set of general principles for data access and disclosure from the beginning.

**Keywords:**
coastal areas, mapping, zoning

**Abstract:** This report discusses methods for the prediction of wave heights throughout the flood hazard areas of the Atlantic and Gulf Coasts. Methods are proposed for the estimation of wave heights at the shoreline during flood conditions in addition to methods for the estimation of wave dissipation and wave regeneration in coastal flood hazard areas. The methods presented in the report formed the basis for flood hazard mapping in V Zones and coastal A Zones.

**Keywords:**
coastal areas, erosion, hazard identification

**Abstract:** In 1988, FIA asked the National Research Council (NRC) for advice on appropriate erosion management strategies, supporting data needs, and applicable methodologies to administer these strategies through the NFIP. This report details the NRC’s conclusions and recommendations with respect to erosion hazard reduction, including: (a) hazard delineation, (b) recommended methodologies, (c) standards for development, (d) the impacts of navigational and flood control projects on shore stability, (e) erosion control through coastal engineering, (f) sand and gravel mining, and (g) subsidence. The report also includes recommendations for improving education, database development, and research. A key recommendation made in the report was the identification of coastlines subject to coastal erosion (E Zones) for the purposes of hazard delineation and determination of federal insurance ratings.

**Keywords:**
Community Rating System, mapping, structural approaches

**Abstract:** The National Association of Flood and Stormwater Management Agencies’ (NAFSMA) mission is to advocate public policies that facilitate the achievement of the public service functions of its member agencies. NAFSMA has identified the following areas of concern with regard to the NFIP and how FEMA is managing this program as it affects the public service functions of its member agencies. NAFSMA’s concerns include: (a) mapping issues; (b) institutional bias against structural flood management projects; and (c) the Community Rating System. The member agencies of the NAFSMA want to work with FEMA on the common goal of protecting the lives and property of American citizens. NAFSMA would like FEMA to recognize the association’s commitment, its expertise, and its unique circumstances. In addition, NAFSMA would like its work products to be more readily accepted by FEMA. To do otherwise is to waste precious resources.

**Abstract:** The objective of flood defense is to reduce the risk to people and the developed and natural environment from flooding. In England, the Ministry of Agriculture, Fisheries, and Food has responsibility for establishing flood and coastal defense policy. The ministry administers enabling legislation, maintains an overview of flood defense investment, and prioritizes investment opportunities for other government agencies. However, the ministry’s flood defense responsibilities extent only to main rivers. Local authorities and Internal Drainage Boards hold permissive powers for ordinary watercourses. The report considers the adequacy of flood warning and public awareness systems, strategy and management of new flood defense, and the performance and maintenance of existing flood defenses. The report found that up to 2 million structures are in areas at risk of flooding. As evidenced by the floods in England in 2000, flood defenses can reduce the risk or extent of damage, but cannot prevent all flooding. A survey of flood defenses found that 43 percent of structures and 36 percent of linear barriers in England are categorized as fair, poor, or very poor. Moreover, collaboration among the numerous governmental and administrative bodies required to plan and implement flood defenses requires time and resources that could be spent more productively. The report recommends further research on the effects of the division of responsibility for flood defense.

**Abstract:** What has been common knowledge to a small group of dedicated coastal engineering professionals for some years is slowly reaching the awareness of the American public—the beaches and shorelines of the nation are washing away with relentless consistency and increasing speed. This report broadly examines the issues and problems associated with coastal erosion and windstorms, including the rising sea level and continued coastal development. The report also briefly discusses the provisions and potential impacts of the Upton-Jones Amendment of 1988, which provides funds for the relocation or removal, under the Standard Flood Insurance Policy, of buildings in imminent danger of collapse from erosion. However, coastal engineers, geologists, and environmentalists fear this measure will provide added incentive for coastal development by removing the financial risk to the property owner. (Note: the National Flood Insurance Reform Act of 1994 repealed the Upton-Jones Amendment.)

Abstract: As required by the Riegle Community Development and Regulatory Improvement Act
of 1994, the National Credit Union Administration (NCUA) submitted this report on compliance
by insured credit unions with the requirements of the NFIP to Congress. The report includes a
description of the methods used to determine compliance, the number of insured credit unions
examined during the reporting year, a listing and total number of insured credit unions found not
to be in compliance, actions taken to correct incidents of noncompliance, and an analysis of
compliance, including a discussion of trends, patterns, problems, and recommendations
regarding reasonable actions to improve the efficiency of the examination process.

Keywords: flood control, flood disaster planning, floodplain management, insurance, levees, mapping,
structural approaches

Abstract: FEMA provided funding for this study and charged the National Research Council
with making unbiased recommendations on levees. The document formulates principles for a
levee policy that will provide equity for protected parties in terms of recognition for efforts spent
in reducing their risk without encumbering program administration with an unwieldy number of
variations in levels of recognition of levee efficacy. The committee defined six dimensions of
levee recognition. The level of design protection appropriate for recognition depends on whether
the application is for 1) reduction in insurance rates, 2) easing regulations for land occupancy, 3)
eliminating requirements for the purchase of flood insurance, 4) permitting siting of critical
facilities, 5) removing requirements for notifying occupants of the hazard, or 6) eliminating warning and evacuation programs. Each recommended distinction was based on the experience and judgment of the committee members integrating technical considerations with economic and administrative factors. Each recommendation is reasoned and presented in the body of the report, and all of them are listed for convenience in a final summary chapter. Table 1 in Chapter 2 condenses the policy recommendations and mapping suggestions on one page.

**Keywords:**
alluvial fans, Base Flood Elevation, erosion, modeling, 1 percent annual chance flood standard, riverine areas

**Abstract:** Many communities, primarily in the western states, have experienced problems with computing flood-water elevations for flood insurance purposes under the NFIP. These problems focused on modeling channel erosion and sedimentation using fixed-bed models for flood insurance studies in communities affected by rivers with movable beds or channels. This study involved the application of six flow and sediment routing models for alluvial streams on reaches of selected rivers for which relatively complete data were available. The objective of the investigation was to determine whether degradation of the riverbed during flood passage has an effect on flood stage that should be incorporated into the calculation of floodzone limits. The authors conclude that, except in cases of rivers which have been severely disturbed by human intervention through local degradation or aggradation, the use of erodible river-bed models instead of fixed bed models cannot be justified in flood insurance studies.

**Keywords:**
coastal areas, erosion, public policy

**Abstract:** More and more of the nation’s vast coastlines are being filled with homes and vacation resorts. The result is an increasing number of structures built on erosion-prone shores with many of these structures facing collapse or damage. In response to mounting property losses, Congress has given FEMA responsibility for incorporating coastal erosion into the NFIP. This book addresses the immediate question of how to develop an erosion insurance program as well as the larger issues introduced by the continually changing face of the nation’s shorelines. The National Research Council (NRC) explores major questions surrounding a national policy on coastal erosion: Should the federal government be in the business of protecting developers and individuals who build in erosion-prone coastal areas? How should such a program be implemented? Can it prompt more responsible management of coastal areas? The volume provides federal policymakers, state floodplain and resource managers, civil engineers, environmental groups, marine specialists, development companies, and researchers with invaluable information about the natural processes of coastal erosion and the effect of human activity on those processes. The book also details the workings of the NFIP and the lessons to be learned from numerous state coastal management programs.
Abstract: This book reviews the Army Corps of Engineers’ investigations of flood control options for the American River Basin and evaluates flood control feasibility studies for the watershed, with attention to the contingency assumptions, hydrologic methods, and other analyses supporting the flood control options. This book provides detailed comments on many technical issues, including a careful review of the 1991 National Research Council report _American River Watershed Investigation_, and looks beyond the Sacramento case to broader questions about the nation’s approach to flood risk management. It discusses how to utilize information available about flood hazard reduction alternatives for the American River Basin, the potential benefits provided by various alternatives, the impacts of alternatives on environmental resources and ecosystems, and the trade-offs inherent in any choice among alternatives which does not lie in the realm of scientists and engineers, but in the arena of public decision making.

Abstract: FEMA provided funding for this study and charged the National Research Council with making unbiased recommendations on alluvial fan flooding. The report addresses a wide range of issues related to alluvial fan flooding as considered by the Committee on Alluvial Fan Flooding. Chapter 1 discusses why the identification of hazards from alluvial fan flooding is controversial and the problems of definitions. Chapter 2 examines types of fans and flooding processes. Chapter 3 presents indicators developed to help delineate alluvial fans and alluvial fan flooding based on the committee’s definition and discusses methodologies to delineate flood hazards on alluvial fans. Chapter 4 contains seven examples of fans in light of the definition and field criteria. The sites represent a range of flood processes, from unconfined water flooding and debris flows on un entrenched active fans to confined water flooding in fully trenched inactive alluvial fans. The examples also show variable amounts of study—from intensive to casual. Chapter 5 presents a summary of the committee’s conclusions and recommendations. One key conclusion states that the act of defining the type of flooding is independent from the act of deciding which methods are applicable for delineating the boundaries of the hazard. To that end, the committee recommends that FEMA expand the technical and regulatory input it receives in the delineation and regulation process, perhaps through the use of a technical advisory board composed of earth scientists, engineers, local regulating bodies, and those being regulated.

Abstract: The act of defining the type of flooding is independent from the act of deciding which methods are applicable for delineating the boundaries of the hazard. To that end, the committee recommends that FEMA expand the technical and regulatory input it receives in the delineation and regulation process, perhaps through the use of a technical advisory board composed of earth scientists, engineers, local regulating bodies, and those being regulated.
Keywords: coastal areas, development, erosion

Abstract: This book explores major questions surrounding national policy on coastal erosion: Should the federal government be in the business of protecting developers and individuals who build in erosion-prone coastal areas? How should such a program be implemented? Can it prompt more responsible management of coastal areas? The volume provides federal policymakers, state floodplain and resource managers, civil engineers, environmental groups, marine specialists, development companies, and researchers with information about the natural processes of coastal erosion and the effect of human activity on those processes. The book also details the workings of the NFIP as well as lessons to be learned from state coastal management programs.

Keywords: Army Corps of Engineers, environmental restoration, federal programs, floodplain management, public policy

Abstract: The Army Corps of Engineers (USACE) has long been one of the federal government’s key agencies in planning the uses of the nation’s waterways and water resources. Though responsible for a range of water-related programs, the USACE’s two traditional programs have been flood damage reduction and navigation enhancement. The water resource needs of the nation have been shifting away from engineered control of watersheds toward restoration of ecosystem services and natural hydrologic variability. In response to these shifting needs, legislation was enacted in 1990 that initiated the USACE’s involvement in ecological restoration, which is now on par with the USACE’s traditional flood damage reduction and navigation roles. This book analyzes the USACE’s efforts in ecological restoration, and provides broader recommendations on how USACE might streamline its planning process. The book also assesses the impacts of federal legislation on the USACE’s planning and projects, and provides recommendations on how relevant federal policies might be altered in order to improve USACE planning. Another important shift affecting USACE has been federal cost-sharing arrangements (enacted in 1986), which mandate greater financial participation in the USACE’s water projects by local cosponsors. The book describes how this has affected the USACE-sponsor relationship, and comments on how each group must adjust to new planning and political realities.

Keywords: American River, Army Corps of Engineers, California, modeling, risk assessment

Abstract: In 1996 the Army Corps of Engineers (USACE) completed a congressionally directed reevaluation of flood control options for California’s American River. In response, Congress authorized a component of the recommended plan but not an adequate plan for the reduction of flood risk in the Sacramento area. Thus, evaluations of alternatives are still required, in particular
because the American River experienced a major flood in January 1997. The 1997 flood suggested that it may be necessary to re-compute flow frequency relationships for the American River at Sacramento. In February 1998, USACE published a revised unregulated rain flood flow frequency analysis for the American River at Fair Oaks. The analysis produced a flood frequency curve that indicates that large floods are appreciably more likely than previously thought. The report prompted controversy among local, state and federal government agencies, public interest groups, and others. This report provides an independent scientific assessment of flood frequency relationships for the American River at Sacramento. The 1 percent annual chance flood estimate recommended by this study would result in removal of some flood-prone areas of Sacramento from the AR Zone, which would result in suspension of building restrictions. However, the uncertainties in these estimates are large. The report recommends the establishment of a new interagency effort that would emphasize research focused on coordinated and cooperative flood risk reduction because the negative consequences of falsely designating certain flood-prone areas to be out of the regulatory floodplain would be catastrophic.

Keywords: Army Corps of Engineers, beach nourishment, federal programs

Abstract: This book provides a basis for decision making with recommendations regarding the utility of beach nourishment and the appropriate role of federal agencies. It also examines the economic and social role of beaches, the history of beach nourishment projects, and management strategies for shore protection; discusses the role of the Army Corps of Engineers and other federal agencies, with a close-up look at the NFIP; explores the state of the art in project design and prediction of outcomes, including the controversy over the use of traditional and nontraditional shore protection devices; addresses what is known about the environmental impacts of beach nourishment; and identifies what outcomes should be targeted for continued monitoring by project officials.

Keywords: Army Corps of Engineers, hydrology and hydraulics, modeling, risk assessment

Abstract: This study describes and evaluates the Army Corps of Engineers’ (USACE) use of risk-based analysis for the evaluation of hydrology, hydraulics, and economics in flood damage reduction studies. The study praises USACE for its adoption of risk analysis methods, but it also raises concern about several technical (modeling) issues. The committee recommended that USACE: (a) use annual exceedance probability as the performance measure of engineering risk; (b) improve its analysis of hydrologic, hydraulic, geotechnical, and economic uncertainties; (c) focus greater attention on the probabilistic issues of identifying, estimating, and combining uncertainties; (d) strive to reduce the considerable variation in the estimates of water surface elevation when using different models of river hydraulics; (e) evaluate the risk-based performance of a levee as a spatially distributed system; (f) undertake statistically ex-post studies
to compare predictions of geotechnical levee failure probabilities as well as ex-post studies of other flood-damage reduction structures; (g) calculate the risks associated with flooding and the benefits of a flood damage reduction project structure by structure, rather than conducting risk analysis on damage aggregated over groups of structures in damage reaches; (h) adopt a consistent terminology for communicating risk analysis concepts within USACE and to the general public; (i) simplify and improve the complex and somewhat confusing criteria for certifying levees for inclusion in the NFIP, and (j) move toward a more comprehensive decision-making approach in flood damage reduction studies.

Keywords: federal programs, floodplain management

Abstract: This report supplements the committee’s comments on a draft of Floodplain Management in the United States: An Assessment Report. The report outlines what the committee regards as the present situation with respect to floodplain management, how federal aims and activities have evolved, and desirable next steps. Floodplain management goals are twofold and interrelated: to reduce the vulnerability of all Americans to the danger and damage of floods and to preserve and enhance the natural values of the nation’s floodplains. After listing the findings from the assessment, the committee recommends the following actions: (a) integrate flood loss vulnerability and protection of floodplain natural values into broader state and community development and resource management processes, (b) improve the data base for floodplain management, (c) give weight to local conditions, (d) minimize conflicts among federal programs, (e) reduce the vulnerability of existing buildings, and (f) improve professional skills and public education. The report provides a table of the federal agencies involved in floodplain management and the programs that each agency provides.

Keywords: federal programs, flood causes, flood control, floodplain management, mitigation, public policy, risk assessment, risk management, risk perception

Abstract: At the request of the House Committee on Science and Technology, the National Science Foundation studied policies and research related to the mitigation of flood hazards. This report deals with basic causes, approaches, responses, and issues, which should lead to policy changes related to the mitigation of flood hazards. It discusses successively the nature and causes of flooding and its geographical distribution, damages, and trends. It reviews available means for coping with floods and details existing public and private institutions involved with mitigation. Two chapters discuss basic human responses to stress, uncertainty, and risk. The subsequent chapters present detailed analyses of geographical areas at high risk from flooding and an outline of a broad conceptual plan for multidisciplinary studies of the impact of floodplain management on the national level. These highlight the necessity to measure the impact and effectiveness of the multiple programs being applied in real or simulated circumstances. Findings and conclusions emerge at numerous points in the report, and these are summarized in a final chapter.
on conclusions and recommendations. For example, the report concludes that an effective system of mitigating flood hazards cannot occur unless local governments take primary responsibility. Meeting this responsibility should involve, according to the report, the availability of flood insurance continuing to be contingent upon appropriate local land-use planning and implementation. Also, federal measures to control floods and financial assistance in the acquisition of flood-prone structures and relocation of occupants out of the floodplain should be contingent on similar factors.

**Keywords:**
environmental protection, federal programs, floodplain management, mitigation

**Abstract:** Several federal agencies pooled their expertise to identify the natural functions of floodplains that reduce flood losses and recommend how the nation can further reduce flood losses through the protection and restoration of the natural functions of floodplains. Because floodplains reduce flooding and limit flood-related damages through their floodwater conveyance and storage functions, the task force advocates: 1) providing technical assistance to improve analytical approaches to floodplain management; 2) encouraging nonstructural solutions to reduce flood damage; 3) improving coordination and partnership among all levels of government and other stakeholders; and 4) ensuring that federal programs are working to achieve complementary floodplain management goals. The report concludes with eight case studies of successful floodplain management strategies around the United States. Successful strategies include cooperation of government bodies at all levels, restoration of open space in floodplains, and collaboration among funding agencies. The appendix lists all federal programs relating to the natural and beneficial functions of floodplains.

compliance, enforcement, floodplain management, floodproofing, mitigation, NFIP, risk communication, strategic planning, structural approaches

**Abstract:** Sponsored by the Tennessee Valley Authority with the cooperation of the Interagency Floodplain Management Task Force, the goal of this seminar was to examine existing and alternative cooperative approaches for evaluating and monitoring floodplain management techniques and community programs. The seminar was intended to assess the “state of knowledge” on this important topic and to suggest some priorities for future interagency research and action. Speakers, panelists, and other participants included university researchers, federal agency staff, state and local government employees, and private consultants who had investigated the feasibility and effectiveness of various techniques or community programs. This report is a collection of three products. Part I presents a brief overview of issues. Parts II and III are issue papers prepared prior to the seminar. Part IV contains papers presented by speakers and
panelists in the seminar addressing specific issues. Finally, Part V provides conclusions and recommendations based on the issue papers, the papers presented at the seminar, and follow-up discussions with selected speakers and panelists. One of the recommendations from the seminar addresses the need for FEMA to improve the compatibility of the data it gathers from flood insurance policies, claims, biennial reports, and disaster assistance claims.

Keywords: federal programs, Hurricane Andrew, Hurricane Hugo, risk communication

Abstract: In the wake of Hurricane Hugo and the Loma Prieta earthquake in 1989, the federal government developed a plan to guide future federal disaster response. The plan received final approval in April 1992 and received a full-scale test only four months later, when Hurricane Andrew struck south Florida in August. Despite the plan, Andrew’s landfall was attended by rampant confusion and miscommunication. FEMA bore the brunt of post-disaster criticism. FEMA’s performance in the days following Andrew resulted in part from imperfections in the plan, which proved overly bureaucratic and inflexible. To improve its emergency responsiveness, the federal government must simplify the presidential disaster-declaration process, continue to bolster the federal response plan, and help local governments boost their own preparedness while making them aware that federal disaster response can take several days even under the best circumstances.

Keywords: building codes, compliance, development, enforcement, floodplain management, mapping, mitigation, New York, NFIP, substantial improvement, variances

Abstract: This manual is designed for use by the person designated by the community as the local administrator of the NFIP. The manual provides guidance to the local administrator on how to understand NFIP requirements and how to apply the community’s floodplain regulations. Chapter I explains the NFIP’s purposes. Chapter II discusses the role of state government – particularly the Department of Environmental Conservation (DEC), the state coordinator for the NFIP. Chapter III discusses local responsibilities under the NFIP. Chapter IV explains the use of the Flood Insurance Study (FIS) and FIRM. Chapter V contains the standards and regulations for development in a floodplain. Chapter VI concerns the duties of the local administrator, with emphasis on the procedure for issuing a floodplain development permit. Chapter VII briefly discusses other permits that might be needed for floodplain development. Finally, Chapter VIII contains information regarding procedures for amending or revising the flood maps. Appendices include a glossary of floodplain terminology, basics of flood insurance, a coastal construction code, and other useful information.

Abstract: The report outlines components of a successful mitigation strategy for flood losses, using efforts by FEMA and the U.S. government as an example for Canadian policymakers. Canada has recently begun to shift from a policy of flood protection to one of flood mitigation. However, mitigation activities tend to be disaster-specific and at the post-recovery stage, without a long-term component. Also, Canada lacks formal federal policy statements or focused delivery systems for disaster mitigation. The report states that successful mitigation strategies require partnerships, clarity of purpose, awareness of context, and acknowledgement of limitations. The author finds these characteristics in FEMA’s mitigation strategies, which embrace public-private partnerships in long-term, comprehensive approaches to mitigation. FEMA’s devotion to mitigation strategies is demonstrated by the inclusion of mitigation in the Stafford Act, the establishment of the Mitigation Directorate in FEMA, and the announcement of a National Mitigation Strategy. However, the bulk of FEMA’s activities are still post-disaster, when funding, political will, and individual incentives are high. Budget issues are a driving force behind mitigation strategies. The report recommends further development of mitigation strategies through the development of a knowledge base for elected officials and citizens, the fostering of political will across jurisdictional boundaries, and the encouragement of public-private partnerships. The report contains an appendix of legislation in each country.

Abstract: The report presents a conceptual model for assessing flood damage to domestic properties in the United Kingdom, building on the authors’ prior critique of damage surveying and repair estimation. Unlike past efforts, the model takes into account building characteristics as well as flood characteristics and includes an assessment of building components that need to be replaced or repaired and the procedures for drying out the flooded building. Location is also important to predicting flood damages. Somewhat counter-intuitively, frequently flooded properties tend to suffer less damage than those that are flooded infrequently because residents tend to be more prepared for flood disasters. The model is intended to assist surveyors and insurers alike and hopes to advance research toward a standardized means of assessing flood damaged properties.

Abstract: When the Mississippi River and its tributaries flooded St. Louis, MO, in the spring and summer of 1993, 250 mental health professionals stood ready to help the thousands whose lives the floods would affect. It turned out, however, that most of the flood victims sought
instead the support of community leaders they knew and trusted. To meet the need for community-based disaster support, disaster intervention training that had been offered to mental health professionals during the summer of 1993 was adapted to train community resource personnel, ranging from clergy to police. The result was Project CREST (Community Resources for Education, Support, and Training). CREST’s purpose is to maximize mental health resources within communities by equipping community leaders to provide initial crisis intervention and emotional relief services after community-wide disasters, when professional resources are often limited. CREST has also been adapted to other types of crisis intervention. Through Project CREST many people have received crisis intervention who otherwise might not have sought mental health care.

**Keywords**: disaster assistance, federal programs, history, legislation

**Abstract**: This report for Congress reviews provisions of federal disaster relief from the nineteenth century though April 1998. It discusses the ad hoc relief provided by Congress until the passage of the landmark “Major Disaster Relief Act of 1950.” Furthermore, the report describes the provisions of that act and reviews subsequent developments leading to the 1970 and 1974 disaster relief acts and later amendments. It identifies the executive agencies that have administered federal disaster relief programs over the years. Appendices outline the emergency and major disaster relief powers of the president authorized by the 1974 Act and present the organization of FEMA, which administers the program.

**Keywords**: cost-benefit analysis, mitigation, urban areas

**Abstract**: This article addresses some basic issues including distributional weights, discount rates, and the value of life in a cost-benefit analysis of urban drainage and provides a framework for the estimation of the optimal amount of investment for flood mitigation. According to the author, such evaluation should involve: (a) estimating the expected total damage from flooding in present-value terms before flood mitigation; (b) computing the reduction in expected total damage as the average recurrent interval of flooding increases; (c) estimating how this interval increases with the amount of investment in flood mitigation; and (d) choosing the optimal investment by equating marginal benefit and marginal cost.

**Keywords**: California, levees, public assistance

**Abstract**: This report details an investigation of flooding in the Central Valley area of northern California in January 1997. The study utilized field interviews with emergency response agencies and citizens to address the initial impacts of flooding on citizens, the immediate public response and evacuation behavior, the dissemination of emergency messages, and the
effectiveness of those messages. The investigation found that emergency response was uneven and the need to coordinate a comprehensive message prior to and during a flood event. A lack of interagency coordination for the procurement of supplies and equipment, such as large earthmoving equipment lead to local agencies bypassing the state’s Office of Emergency Services’ authorization and informally exchanging equipment among themselves. While the strategy was successful in this event, there is considerable potential for misallocation of resources in future disasters. Public preparedness varied with experience with past flooding. The study recommends that reliance on levees be re-evaluated, and that governments strive for better interagency coordination and public information.

Keywords:
federal programs, floodplain management, Ireland
Abstract: The report describes floodplain management strategies in Ireland. Various state agencies are involved in floodplain management: the Office of Public Works, the Electricity Supply Board, local authorities, Met Eireann, and emergency response agencies. The author characterizes the current strategy as reactive, localized (rather than watershed-based, with inadequate resources, and a confusing division of responsibilities between state agencies). These difficulties are exacerbated by the public expectation for aid, the lack of adequate flood warning systems, and gaps in floodplain management data, such as flood maps. To address these problems, an Expert Review Group was established in January 2003 to examine the current approach to flood, clarify roles and responsibilities of various agencies, examine existing legislation, and make recommendations to redefine the approach to flood relief in Ireland. A report was expected from the group in August 2003.

Keywords: buyouts, easements, environmental policy, federal programs, floodplain management, floodproofing, mitigation, nonstructural approaches, relocation, wetlands
Abstract: This handbook, produced in cooperation with various federal agencies, provides information about federal programs that support nonstructural approaches to floodplain management, including broad strategies and specific federal programs that could form the basis for a nonstructural response to a flood event. Programs are grouped by three primary strategies: (a) acquisition, relocation, elevation, and floodproofing of existing structures; (b) rural land easements and acquisitions; and (c) restoration of wetlands. Programs offering technical assistance for floodplain management are also reviewed. Summaries of 36 federal programs include information about each program’s objective, agencies involved, form of assistance, program target, eligibility requirements, cost-sharing requirements, available funding, repayment requirements, application procedures, and contacts. The agencies that offer these programs include FEMA, the Army Corps of Engineers, National Park Service, Natural Resources

**Keywords:** wetlands

**Abstract:** The Office of Technology Assessment (OTA) collected data from scientific literature; government reports; and responses to questionnaires about wetland use from 37 districts of the Army Corps of Engineers, 48 states, and from 11 trade associations. OTA also conducted case studies of wetland trends in 13 states, minor studies in eight states. These studies were supplemented with interviews of federal and state officials and industry representatives. As a result of its studies, OTA has identified three issues related to wetlands management. First, should federal involvement in protecting wetlands be increased or decreased? Second, should the federal government improve its policymaking capability through a systematic collection and analysis of additional information about wetlands? Finally, should the federal government develop a more integrated approach for managing the use of wetlands?

**Keywords:** lending institutions, mandatory purchase, Office of Thrift Supervision

**Abstract:** This report was submitted to Congress in accordance with the requirements of the National Flood Insurance Reform Act of 1994. The report describes the methods used to determine compliance, the number of insured credit unions examined during the reporting year, a listing and total number of insured credit unions found not to be in compliance, actions taken to correct incidents of noncompliance, and an analysis of compliance, including a discussion of trends, patterns, problems, and recommendations regarding reasonable actions to improve the efficiency of the examination process. OTS conducted 631 compliance examinations during the reporting period of September 1, 1994, to August 31, 1995, and found a total of 451 violations of the flood insurance regulations at 98 institutions. Most of the violations involved the failure to provide flood insurance notice or the failure to comply with the timing provisions for these notices. Furthermore, OTS found that overall compliance levels, measured as a percent of the institutions examined where no flood insurance violations were cited, ranged from a low of 78 percent in 1991 to a high of 88 percent in 1993.

Abstract: These reports were submitted to Congress in accordance with the requirements of the National Flood Insurance Reform Act of 1994. The report describes the methods used to determine compliance, the number of insured credit unions examined during the reporting year, a listing and total number of insured credit unions found not to be in compliance, actions taken to correct incidents of noncompliance, and an analysis of compliance, including a discussion of trends, patterns, problems, and recommendations regarding reasonable actions to improve the efficiency of the examination process. OTS conducted 950 compliance examinations during the reporting period of September 1, 1997, to August 31, 1999, and found a total 345 violations of the flood insurance regulations at 95 institutions. Most of the violations involved either the failure to provide, or the failure to complete the Standard Flood Hazard Determination Form; the failure to provide the flood insurance notice or to comply with the content or timing provisions for these notices; and the failure to comply with the purchase requirements. Furthermore, OTS observed that savings associations increased their overall compliance level from 84 to 90 percent from September 1, 1994, to August 31, 1999. OTS anticipates further increases in the future due to increased awareness of the importance of compliance with flood insurance regulations.

Keywords: California, economic impacts, economic modeling, levees, Midwest floods of 1993

Abstract: Large-scale flooding in northern California and the Midwest floods of 1993 demonstrate that floodplain management should be conducted for regions rather than for individual floodplains. Economic activities connect each floodplain to other floodplains and to areas not affected by flooding. A method is presented to estimate the economic effects of flooding over a region of interacting floodplains and other lands by incorporating a Leontief economic input-output model with a probabilistic description of the potential overtopping in a system of levees. Expected economic damages may be greater if flooding reduces the availability of floodplain products that are used as inputs to other sectors of the economy. The model is used to evaluate the economic risk for an example of a distributed system of levees.

**Keywords:**
buyouts, development, floodplain management, levees, modeling, Pennsylvania

**Abstract:** A dynamic model of floodplain management is developed that addresses nonstationary conditions, including land-use changes, channel modifications, economic development, and climate change and variability. The dynamic approach permits zoning, levee construction, and other decisions to be made sequentially, rather than only at the present. The dynamic model is formulated as a Markov decision process. A single-floodplain, single-objective, stationary model is extended to include multiple floodplains, nonstationarity, and multiple objectives. Linear programming is used for solution, though the problem may be large. The model is applied to a problem at Chester Creek, PA. The optimal policy for levee building or replacement depends on whether a flood has just occurred and on the costs of buying out properties and rebuilding homes and levees. Two cases of nonstationarity are examined—future bridge construction and future hydrologic changes. With nonstationarity, a buyout of properties following levee overtopping is an optimal policy since increased future flooding reduces the expected benefits of structural flood measures. When economic development is included with management costs and flood damages in a multiobjective formulation, the optimal policies include building larger levees and increasing floodplain development.

**Keywords:**
cost-benefit analysis, economic modeling, flood damage, methodology, zoning

**Abstract:** The economic yield of a floodplain-zoning program is measured by a cost-benefit analysis. The methodology entails the use of a probabilistic hydroeconomic model to evaluate expected flood damages with and without zoning. The application shows that this type of program, albeit cost-effective overall, may be unacceptable for various reasons to the various parties involved. While the program is cost-effective for all parties of the society, it is redistributive. Landowners are the main beneficiaries, while the cost-benefit ratio for governments is consistently less than one. Owing, however, to market imperfections, landowners gain no advantage from promoting such programs. This is an explanation why such programs are not implemented more widely.

**Keywords:**
insurance purchase decision, structural approaches
Abstract: To address the extent to which specific risk perceptions affect consumer willingness to purchase personal insurance, the study examines the relations between perceived risks of tornadoes and the likelihood of purchasing a protective device. This research suggests that if an individual believes that he or she is at great risk of being affected by a tornado he or she may be more willing to purchase an in-home shelter for protection. However, the perceived risk of being affected did not appear to be related to the amount that someone would be willing to pay for a protective device. Those who perceived a high likelihood of being affected by a tornado were not willing to pay more money for a protective device than were those who perceived less likelihood of being affected. This suggests that greater perceived risk affected the desire for protection, but not at any cost. Methodological obstacles prevent the generalization of the results. While this research offers some insight into how risk perceptions of a specific natural disaster affect one’s willingness to purchase protection, the sample size was rather small. Furthermore, the research probed behavioral willingness to purchase a tangible device that protects against a specific hazard; it is unclear how these results might generalize to an intangible product such as flood insurance.

Keywords: economic impacts, Europe, insurance industry

Abstract: The floods in Europe during the summer of 2002 resulted in considerable property damage and reopened the debate about whether to insure flood losses and how public authorities and private insurance actors should be involved in the management of flood risks and insurance claims. Many sectors of the European economy suffered financial losses, including private property, infrastructure, and agriculture. Yet only a small part of these losses (10 to 20 percent) were covered by insurance because flood damage is not included in standard insurance coverage in the affected regions. The article then goes on to explore ways of strengthening the European insurance industry so that it would be better able to pay for damages in the event of natural catastrophes.

Keywords: development, economic modeling, floodplain management, Indiana, property values

Abstract: There is a long-standing hypothesis that imperfect information about potential flood hazards, an expectation of liberal disaster relief, and anticipation of future structural protection have resulted in overdevelopment of floodplains. Data for a case study from Logansport, IN, were analyzed using multiple regression techniques in an effort to investigate this hypothesis. The effect of the introduction of the NFIP on residential property values was investigated in order to determine whether property values in floodplains were fully discounted for expected flood damages. The case study analysis shows that property values in the floodplain were less than fully discounted for the existing flooding potential prior to the introduction of the NFIP. Low-cost information such as lot elevation and distance from the river were found to affect sale price, apparently due to its role in the formation of perceptions about the potential for flooding. Policy alternatives for floodplain management that would provide better information on flooding
potential and eliminate the perverse incentives created by the expectation of liberal disaster relief include simple zoning and actuarial insurance. Simple delineation of the 1 percent annual chance floodplain with zoning restrictions would involve relatively low implementation costs, while the development of actuarially accurate premiums for flood insurance would be relatively costly. In any case, the study results indicate that unless policy changes eliminating the perverse incentives of past policies are adopted, overdevelopment of floodplains will continue.

Keywords: Hurricane Isabel, insurance claims, Maryland

Abstract: The article concerns Maryland’s investigation of the handling of flood insurance claims filed by victims of Hurricane Isabel. The insurance commissioner’s office received more than 1,300 inquiries and 280 formal complaints following the 2003 hurricane. The most common complaints were that property owners did not realize their flood policies were more restrictive than typical homeowners’ insurance policies, and that claims adjusters provided lower estimates of repair costs than did independent contractors. According to FEMA, 24,066 flood claims from Hurricane Isabel were filed in five states. Sixteen percent of the over 21,600 claims closed to date were closed without payment. In response to complaints, FEMA officials stated that adjusters and private insurance companies do not have an incentive to undervalue estimates because of the way in which they are compensated by the NFIP.

Keywords: flood causes, flood control, floodplain management, hydrology and hydraulics, ice jams, insurance industry, risk assessment, reinsurance, structural approaches

Abstract: The report discusses and compares flood risk, vulnerability, floodplain management, and flood insurance schemes worldwide. It begins with a description of selected flood events of the past 30 years that have had countrywide impacts, including a special report on the Central European Floods of August 2002. The flood affected residents in Germany, the Czech Republic, Slovakia, and Austria, killing more than 100 people. From flood events, the report moves to risk and vulnerability, stating that risk is created by the placement of valuable assets in vulnerable locations. Estimations of risk depend on the methodology for assessment and hydrology and hydraulic data. The most important factors in hazard risk assessment are rainfall patterns and severity over the watershed area, flow patterns, soil type and vegetation, and the shape of the watershed. The report finds, however, that these factors are not always considered in floodplain management and mitigation activities. Future trends in land use, climate, and infiltration are incorporated into structural mitigation projects or in estimates of maximum flooding levels. Assessments are typically based on past events, using data for a limited amount of time. The report also identifies other causes of floods, including storm surges, estuarine floods, dam and dike failures, ice jams, rain-induced mudflows, tsunamis, and subsidence. Flood risks are considered in the context of residential, commercial, industrial, infrastructure, and civil engineering project vulnerability. The report opines that the factors that affect flood risk – frequency and severity – also affect the efficiency of public and private involvement in flood
insurance. For instance, nationwide private insurance pools or government-sponsored schemes are suitable for countries with frequent flooding. Where properties are flooded with a recurrence period of less than 10 years, private insurance companies are unwilling to offer insurance. Floodplains with high severity and a low frequency of flooding are more difficult to manage. Property owners are unlikely to perceive correctly the risk of flooding, making them unwilling to pay an actuarially correct price for insurance. Governments may decide that providing post-disaster relief is more politically attractive than funding predisaster mitigation efforts. The report describes the flood insurance models used in the United States, France, Spain, and Norway.

Keywords: agency operations and management, history, NFIP

Abstract: The author overviews the NFIP, beginning with a short history. He then discusses the three components of the program’s structure (risk identification, hazard mitigation, and insurance), and explains how the components need to be integrated through the cooperation of the federal government, state and local governments, and the insurance industry. The next section of this chapter describes the various initiatives of the NFIP, including the National Flood Insurers Association, the Write-Your-Own (WYO) Program, and the Community Rating System. He concludes with a discussion of issues facing the NFIP and offers some solutions to those issues. Among others, Pasterick concludes that although the NFIP has been able to integrate its three critical components in the past, within the current structure of FEMA the risk identification and mitigation responsibilities are organizationally separated from the insurance operation. Continued coordination under this structure will require a level of effort beyond that needed when the three components were in the same office. Pasterick also notes that a major issue to be addressed in the area of mitigation is the matter of existing structures. Consensus on this issue is needed in order to make any policy effective. Furthermore, Pasterick discusses the NFIP’s low market penetration. He lists five reasons for this low market penetration: (a) many floodplain residents underestimate the seriousness and likelihood of flooding; (b) lenders have not been especially zealous in requiring the purchase of flood insurance as the law requires; (c) policies for flood insurance are difficult for insurance agents to write and, therefore, to market aggressively because they are single-peril policies and are viewed as more costly than other lines of coverage; (d) many potential consumers expect that federal disaster assistance will adequately provide for post-flood recovery; and (e) many people are simply misinformed or unaware of the availability of flood insurance.

Keywords: disaster assistance, flood disaster planning, mitigation, Oklahoma, substantial damage

Abstract: On Memorial Day, 1984, more than a foot of rain fell on Tulsa. The resulting flood killed 14, injured 288, and left $188 million in damages citywide. On the day of the flood, city leaders met and agreed to approach the post-flood recovery from a new angle. This report
focuses on Tulsa’s floodplain clearance activities – one aspect of the city’s comprehensive flood-hazard mitigation program – with emphasis on acquisition projects following the 1984 flood. The scope of the project included the acquisition of 300 homes from nine sites. Two years later, the city bought 228 flood-prone pads at a flooded mobile home park. The report is based on the remarkable work of many people including proactive citizens; courageous political leaders and civil servants; a diligent local news media; generous national experts; and partners in FEMA and the Army Corps of Engineers.

Keywords: Kansas

Abstract: The study analyzes the performance of emergency actions taken by local governments in Augusta and Arkansas City, Kansas following a major flash flood in November 1998. The study used fieldwork and a questionnaire survey to gauge satisfaction with four emergency response measures: flash flood watches, the issuance of flash flood warnings, flood evacuation, and other emergency measures, such as sandbagging, traffic control and food distribution. Prior research has extensively documented individual response to disaster events, but little is known about the adequacy of the emergency response measures used by local governments. The analysis shows that emergency response efforts and support from external sources were rated poorly by flash flood victims, either because they were not implemented properly or in a timely manner. Satisfaction did not vary with respondents’ socioeconomic and demographic characteristics. Flood victims’ overall satisfaction with aid from external sources, such as the Red Cross, Salvation Army, Army National Guard, and area churches was higher than with the four emergency response measures analyzed in the report. The results suggest that improvements are needed in forecasting, warning, evacuating, and mitigating flash flood events, and that federal emergency agencies should be more sensitive to the needs of disaster victims.

Keywords: methodology, national disasters

Abstract: Distinguishing characteristics and issues of comparative and cross-cultural research, problems and opportunities, and an assessment of future prospects are offered and related to disaster research. No single approach is advocated; rather, various approaches (case study to cross-national, contemporary to historical, and qualitative to quantitative) are recommended. Methodological issues including model specification, problems of aggregation, intra- versus international variation, and secondary versus primary data collection are addressed. Particular attention is devoted to issues of equivalence related to conceptualization, data comparability, operationalization and measurement, conversion, standardization, and units of observation. The need for systematic efforts to develop research tools that can be utilized to measure critical concepts such as recovery, restoration, risk, and mitigation is identified. Finally, discipline-based, yet disaster relevant, cross-national and comparative research agendas consistent with a broader ecological perspective targeting disasters, development, and the social production of vulnerability are advocated.

**Keywords:**
compliance, enforcement, floodplain management, Pennsylvania

**Abstract:** This suggested ordinance was prepared to help municipalities meet the requirements of the NFIP and the Pennsylvania Floodplain Management Act (Act 166 of 1978). More specifically, this ordinance contains all the provisions necessary to comply with the requirements of Section 60.3 (d) of 44 CFR (NFIP) as well as with the requirements of Act 166 of 1978 and the regulations adopted by the Department of Community and Economic Development pursuant to that Act.

**Keywords:**
compliance, enforcement, floodplain management, Pennsylvania

**Abstract:** This publication outlines the Commonwealth’s floodplain management regulations adopted pursuant to the Pennsylvania Floodplain Management Act (Act 166 of 1978). Topics addressed by the regulations include: municipal participation in the program, adoption of floodplain management by identified municipalities, municipal loss of eligibility to participate in the program, regulation of particular obstructions, coordination and uniform enforcement of municipal floodplain management regulations, inspections, enforcement by the department and appeals, and reimbursements and grants to municipalities.

**Keywords:**
compliance, development, enforcement, floodplain management, floodproofing, floodway, mobile homes, Pennsylvania, permits, substantial improvement, variances

**Abstract:** To participate in the NFIP, a municipality must enact a code or ordinance, which at a minimum, meets FEMA’s floodplain management requirements. This means that a participating municipality must regulate all construction and development within those areas of the community identified by FEMA as being flood-prone. To accomplish this, a municipality must issue a building permit before any construction or development takes place. This ensures that the municipality has the opportunity to review all proposed activities for compliance with any applicable floodplain management regulations. While it may sound rather simple and straightforward, it is not always an easy matter to distinguish between those activities that
require a permit and those that do not. The report provides information to help municipalities become more confident in making this determination.

**Keywords:** awareness, media, Puerto Rico, risk communication, risk perception

**Abstract:** The report involves a case study of the way in which the Puerto Rican media has influenced the development of risk perception and disaster awareness among residents of Tortuga, which was struck by four floods in a short period of time. This case study is used as a means of examining the gap between actual damages and the perception of risk by flood zone residents. The report cites a body of past literature that the mass media has a significant influence on risk perception and disaster awareness. However, the author argues that the media provides a standardized message to a widely diverse audience, which varies significantly by demographic characteristics, socio-economic status, political context, and cultural tradition. For media messages regarding natural disasters to be effective, they must not only be abundant but also provide specific, actionable messages, consistent across different mediums, and be backed by a credible source, such as scientists or government agencies. The paper is based on the idea that having access to and being exposed to information provided by the mass media about natural disasters does not necessarily increase disaster awareness, even assuming that the media portrays disasters and natural hazards accurately. This assumption is not always correct. In the survey, interview participants were questioned regarding their awareness of the possibility of experiencing a flood, if they received information about floods through the media or other sources before the disaster, and how useful they considered the media coverage of disasters to be in the event. The study found that virtually none of the interviewed residents recalled receiving warnings of heavy rain and that the role of the media was limited during the disaster. The residents of Tortuga did not receive any relief aid from FEMA, because, as the agency argued, it was a small-scale disaster and the residents did not have flood insurance on their properties. The lack of flood insurance was due to the fact that FEMA did not identify the area as vulnerable to flood. Also, most homes were built without mortgages, thus the mandatory purchase process was not triggered. But most important, most residents were not aware of the availability of flood insurance. The major finding of the study is that the influence of the mass media is mediated by the personal experience of the audience and the degree to which disaster information is targeted to a particular group of individuals.

**Keywords:** disaster planning, modeling, risk communication, Texas, Washington

**Abstract:** This study develops a model of evacuation compliance behavior based on secondary empirical analyses of three disasters—a flood in Abilene, TX, a hazardous materials incident in Mt. Vernon, WA, and the eruption of Mt. St. Helens in Washington. Following a brief discussion of the theoretical modeling process, factors influencing individuals’ evacuation decisions are
identified: warning confirmation, source credibility and content, perceived risk, possession of an adaptive plan, and family context. The data support the assertion that families evacuate only after all members are present or known to be safe. According to the author, the creation of an adaptive plan (through warning information, prior experience, and/or preplanning) would facilitate compliance with evacuation warnings, as does the belief that the impending disaster would result in direct personal harm. Furthermore, evacuation is promoted by the credibility of the source of information. Finally, the author concludes that the most effective warning messages are specific concerning the danger, consequences, timing, and response strategies in the face of disaster.

**Keywords:** risk communication

**Abstract:** This article examines the problem of communicating information about floods to multiethnic communities. Data were gathered from interviews of a probability sample of 200 recipients of flood evacuation warnings living in a small western U.S. town with a large population of Mexican-Americans. Analyses reveal that residents surveyed were more skeptical than whites about warning messages, no matter how specific the message; interpreted the same warning messages as indicating lower levels of personal danger; and were less likely to undertake a protective action (i.e., evacuate) than white residents.

**Keywords:** floodplain management, Switzerland

**Abstract:** The document describes the components of flood protection in Switzerland: hazard mapping, setbacks, damage reduction, emergency planning, and compulsory insurance. Hazard zones are color-coded based on risk and correspond to building regulation. Accurate and complete hazard maps enable all floodplain management activities. Setbacks support flood protection objectives as well as ecological objectives, preserving flora and fauna in riparian areas. Emergency planning consists of weather forecasts, alarm systems, mobile protection devices, and emergency storage areas. In the majority of the country, insurance companies provide insurance for all natural disasters in a single package, making participation easier for homeowners.

**Keywords:** climate change, coastal areas, environmental impacts, environmental policy, environmental protection, federal programs, legislation
Abstract: The United States depends on the health of its oceans. Yet ocean habitats face significant threats, in part because of increased development of coastal areas. More than half the U.S. population lives in coastal counties and their populations are expected to increase by 25 million people by 2015. More than 60 percent of coastal rivers and bays are moderately to severely degraded by nutrient runoff, and many ecologically and commercially important fish species face overfishing and pollution threats. The report attributes the current crisis to a failure of perspective and governance and states that current human interactions with the oceans are unsustainable. Moreover, existing ocean policy is outdated and insufficient. The principal laws governing coastal zones, endangered marine mammals, ocean waters, and fisheries were enacted over 30 years ago on a crisis-by-crisis, sector-by-sector basis. Though some issues from that time are still relevant today, new environmental, economic, and policy challenges have emerged. The commission recommends that oceans be viewed as a public trust and that national ocean policy and governance be changed to reflect principles of ecosystem health, sustainability, and precaution.

Keywords: attitudes, Australia, communication, risk communication, risk perception

Abstract: When the city of Grafton was threatened by severe flooding in March 2001, fewer than 10 percent of the population left the city when officials issued a flood evacuation order. The purpose of this research project was to estimate the extent of the evacuation from Grafton and to determine the reasons why people evacuated when the order was given. Data confirmed that few people evacuated from Grafton, although substantially more (47 percent) were ready to do so at a later time. The article also pointed out that although 97 percent of Grafton residents were aware of the evacuation order, three-quarters of the survey respondents who did not evacuate did not believe that they were truly in danger. After discussing the research findings, the article makes a number of suggestions for improving the public’s readiness to respond to an evacuation warning, including improving the planning and execution of door-knocking operations and ensuring that messages to the public are credible and consistent.

Keywords: Australia, awareness, flood disaster planning, media, risk communication

Abstract: The paper examines some of the recent lessons learned by the State Emergency Service (SES) regarding flood warnings. The SES conducts postoperational reviews following major flooding, including public meetings and surveys. In New South Wales, the SES supplements flood warnings from the Bureau of Meteorology with other information, then issues them to media outlets as Flood Bulletins. Flood Bulletins are often overly long, containing lists of information ill suited to radio broadcasts. Their importance is integral to flood safety. In a survey of residents in Grafton following a 2001 flood, while only 13 percent of respondents evacuated, nearly a third of those who remained were prepared to evacuate, based on flood
warnings. Thus, while a large portion of the population was receptive to evacuation, many delayed the decision until the last minute possible. Based on this information, the report recommends that future flood warnings focus on actionable details for their audience, describe a timetable of events for residents, and feature clear consequences for failure to evacuate. To address community education, SES has formulated a series of FloodSafe guides, tailored to individual towns, which describe local flood problems and give general flood safety advice.

Keywords: federal programs, flood control, history, Midwest floods of 1993, mitigation
Abstract: This article examines the Midwest floods of 1993 by providing a history and detailed description of the event and pertinent mitigation policies. It describes three case histories from which the author concludes that the programs that pursue the intended goals of the U.S. flood control policy are flawed. (Such intended goals are to protect development where it is economically justified, to prevent and reduce damageable development, and to compensate those who suffer blamelessly and excessively from flooding.) The author argues that mitigation programs to reduce flood damages are still a minor part of the NFIP. The author complains that the NFIP provides protection to private properties without calculating the cumulative costs of providing that protection, and that the “overly generous” payments in compensation for agricultural flood damages eliminate the risk and make it highly profitable to farm in a floodplain. However, the author warns the reader that the conclusions are general and were drawn from the three case histories described in the report. Whether these cases are merely anomalies or whether they are true reflections of these programs is beyond the scope of the work.

Keywords: disaster assistance, environmental impacts, flood control, public policy
Abstract: The author claims that U.S. flood-control policy (as of 1995) wastes money, promotes behavior that exacerbates the problem, distributes relief disproportionately, and damages the environment. The author also claims that although better policies are neither expensive nor technologically difficult, they require the resolution of some sticky issues, equity and firmness in their execution, and, most important, the political backbone to make flood-control decisions before an emergency arises. New policy should reduce ad hoc disaster aid, establish a means test for distributing it, and use the savings to reduce damages and restore wetlands; incorporate disaster funding into the annual budget process; tighten existing flood- and crop-insurance programs; limit new structural protection to key facilities and examine the economic justification for repairing existing ones; and promote more and better flood research.

Keywords: economic impacts, environmental impacts, floodplain management, history
Abstract: This book synthesizes the past development and status of floodplain management in 1995. It describes the nature of flooding, its causes, and its importance in the ecological cycle and defines the conflict of interest between ecological and economic values inherent in floodplain management. Philippi reviews the historical and logical development of floodplain management policy. She also identifies the problems encountered in the execution of agreed-upon floodplain management objectives and it describes some scenarios, successful and otherwise, that future floodplain management may follow.

Keywords:
flood causes, flood damage, modeling, weather

Abstract: This paper presents a conceptual framework for the systematic assessment of the factors that condition observed trends in flood damage. Using the framework, it assesses the role that variability in precipitation has in damaging floods in the United States at both the national and regional levels. Three measures of flood damage each lead to different conclusions about the nature of the flood problem. At a national level, the precipitation measures most closely related to flood damage are the number of two-day heavy rainfall events and the number of wet days. This study indicates that growth in recent decades in total damage is related to both climate factors and societal factors. At the regional level, this study reports a stronger relationship between precipitation measures and flood damage and indicates that different measures of precipitation are most closely related to damage in different regions. The study indicates that climate plays an important, but by no means determining, role in the growth of flooding in the United States in recent decades.

Keywords:
flood damage, weather

Abstract: This study is a reanalysis of flood damage estimates collected by the National Weather Service (NWS) between 1925 and 2000. The NWS data are estimates of direct physical damage due to flooding resulting from rainfall or snowmelt. They are obtained from diverse sources, compiled soon after each flood event, and not verified by comparison with actual expenditures. Therefore, a primary objective of the study was to examine the scope, accuracy, and consistency of the NWS damage estimates to improve the data sets and offer recommendations on how they can be appropriately used and interpreted. Evaluation of the accuracy of the estimates led to the following conclusions: individual damage estimates for small floods or for local jurisdictions within a larger flood area tend to be extremely inaccurate, damage estimates become more accurate at higher levels of aggregation, and floods causing moderate damage are occasionally omitted, or their damage greatly underestimated in the NWS data sets. In summary, the NWS flood damage estimates do not represent an accurate accounting of actual costs, nor do they include all of the losses that might be attributable to flooding. Rather, they are rough estimates of direct physical damage to property, crops, and public infrastructure.

Keywords:
Germany, natural disasters, risk perception

Abstract: The report begins with the assumption that perception and evaluation of risk are basic for our behavior in dangerous situations, as well as decisions concerning preventative, protective measures against risk. The study uses questionnaire data from 450 persons in six districts in Germany to evaluate perception of risk regarding several natural disasters, including flood, storms, and earthquakes. Respondents assigned varying levels of risk to different natural disasters. The respondent’s own experiences with damage from particular natural disasters seemed to heighten their perception of risk.

Keywords:
floodplain management

Abstract: This article highlights four recommendations from Sharing the Challenge (commonly called the Galloway report) that lay the framework for continued policy evolution and development. First, the author recommends improved federal coordination in floodplain management programs and policy. Second, a more strategic and managed system of delivering flood programs across a broad geographic region is needed to replace the current system. Third, the executive order on floodplain management, issued in 1977, should be revisited and modified to reflect policy developments, including the identification of a monitoring and enforcement mechanism. Finally, alternative means of quantifying federal interests in the environment and other policy areas are needed to resolve some of the confusion surrounding the criteria for justifying projects.

Platt, Rutherford H. (1976). The National Flood Insurance Program: Some Midstream Perspectives. Keywords:
floodplain management, legislation, takings

Abstract: This report argues that the NFIP has been a necessary tool to supplement federal flood control works and disaster relief and looks at its progress to date. The number of communities participating in the NFIP has increased dramatically from four communities in its first year to 13,000 in 1976. The increased participation is due in part to program amendments in the Flood Disaster Protection Act of 1973. However, the report warns that the most difficult step of fully implementing the NFIP is still ahead – the incorporation of local governments into the regular, as opposed to provisional, program. In the author’s estimation, the NFIP needs to overcome the hurdles of constitutional issues involved in takings without compensation, the technical challenges of mapping, the establishment of premium rates, and the determination of regulatory standards regarding floodways to fully implement floodplain management.

Platt, Rutherford H. (1985). Congress and the coast. Environment, 27(6), 12-7, 34-40. Keywords:
Coastal Barrier Resources Act, coastal barriers, development, legislation

Abstract: Written not long after passage of the Coastal Barrier Resources Act (CBRA), this article notes that CBRA did not expressly prohibit the right of private owners to develop their property on the coast. It simply denies some, but not all federal benefits (e.g., flood insurance) when property owners decide to develop. CBRA did not affect other forms of federal help such as federal disaster assistance to repair infrastructure and income tax write-offs for casualty losses and accelerated depreciation after a loss. The author argues that by increasing the risk in these areas, CBRA may have increased pressure for private development of adjoining areas that are still entitled to the full spectrum of federal benefits, such as flood insurance.

Keywords: floodplain management, public policy, urban areas

Abstract: Flood damage is increasing in U.S. metropolitan areas because of urbanization in small watersheds and floodplains and because of inadequate storm drainage. The NFIP is a necessary but insufficient response to the problem. Additional measures and programs tailored to the particular region are needed since each area has different flood problems and operates in a different legal and political framework. Three regional districts were examined and their attempts at solving the problems associated with flooding are described. All three districts reflect a viewpoint that may be emulated elsewhere: metropolitan floods are an area-wide phenomenon requiring a regional response. Local floodplain management, state, and federal mitigation efforts are necessary, but regional districts fill a functional and administrative gap in the hierarchy of public authority. Regional districts interact with other governmental organizations as well as act independently, as exemplified by the described detention policies of the districts in Harris County, TX, and Chicago, IL. A regional district also may perform a particular function more competently than another unit of government as shown by the example of floodplain maps developed by the district in Denver, CO. The fiscal autonomy of the regional district allows it to take needed actions promptly and at no cost to the federal or state taxpayer. It is concluded that regional districts are effective in reducing flood losses.

Keywords: Australia, Canada, Germany, Japan, public policy, United Kingdom, urban areas

Abstract: This report examines responses to metropolitan flooding at a regional level, that is, on a scale broader than individual municipalities, but narrower than the state. Unlike municipalities and states however, regions usually lack easily identifiable political surrogates. Governance of metropolitan regions is a patchwork quilt of traditional units of government—local, county, and state—supplemented by a variety of programmatic adjustments. Such adjustments include regional planning entities, special districts and authorities, intergovernmental agreements, boundary changes, and the modernizing of existing county units. Part one of this volume describes three stages of research on regional experiences in the United States. Part two consists of five case studies, conducted simultaneously with the domestic ones, concerning response to metropolitan flooding in Canada, Great Britain, Australia, Germany, and Japan. These studies
illustrate the effects of differing legal and political contexts, as well as diverse hydrologic regimes, on governmental response to metropolitan flooding.

**Keywords**: floodplain management, levees, Midwest floods of 1993, Mississippi River

**Abstract**: The author reports on the floodplain management policies of the Mississippi River Basin. He reexamines flood control policies and discusses the disaster brought about by improper floodplain management. The author asserts that filling wetlands for the agricultural construction of levees exacerbated the Midwest floods of 1993. Finally, the author discusses decisions about the rebuilding of levees and its stress on interagency and intergovernmental cooperation.

**Keywords**: natural disasters, public policy

**Abstract**: This book is concerned with the political response to natural disasters, however they may arise. Specifically, the author is interested in the changing role of the federal government from distant observer to immediate responder, principal financier of disaster costs, and, more recently, champion of hazard mitigation. The book raises the question as to whether federalizing the costs of disasters is helping lighten the overall burden of disasters or, perversely, whether it is making matters worse. Additionally, have the availability of federal disaster assistance, flood insurance, and other benefits inadvertently contributed to a false sense of security, roughly equivalent to the discovery in the 1960s that federal flood control projects were stimulating development in protected floodplains?

**Keywords**: beach nourishment, coastal areas, development, erosion, Hurricane Hugo, nonstructural approaches, relocation

**Abstract**: This text examines the extent and spatial distribution of coastal erosion and the role of human intervention in both accelerating and preventing further erosion. The authors go on to analyze the federal responses to coastal erosion, in the form of physical alterations and financial incentives, such as the NFIP. The legislative restrictions on coastal construction and responses to coastal erosion are examined in 10 states and compared for common approaches. The authors find that most states focus on prospective development, allowing existing homes to be “grandfathered” into regulations. With the exception of a defunct program in Michigan, no state has attempted to encourage or subsidize voluntary relocation of structures from eroding coastlines. Public acquisition of eroding areas and repetitively flood-damaged areas is not a major part of state environmental programs. The largest obstacle to the adoption and implementation of restrictions on coastal development is political considerations, perhaps exacerbated by the perception of a safety net from the NFIP and from FEMA’s disaster
assistance programs. Where regulations do exist, they tend to be too narrowly defined, with significant loopholes: procedures in the wake of a catastrophic storm allow a lenient application of the substantial damage determination, and generally facilitate rebuilding in the same hazardous areas.

**Keywords:**
Hurricane Bertha, Hurricane Fran, mitigation, North Carolina, substantial damage

**Abstract:** For a quarter century, North Carolina has sought to manage new oceanfront development under its 1974 Coastal Area Management Act. The results of these planning efforts were put to the test in 1996 when Hurricanes Bertha and Fran struck the state within a two-month period. With beaches and dunes impaired by Bertha, Fran inflicted widespread devastation along the southern half of the state’s open ocean coast. The rebuilding process was fueled by federal disaster assistance of many kinds, including emergency dune replacement, flood insurance payments, and loans from the Small Business Administration to homeowners. This report looks at the rebuilding of the North Carolina coast after Hurricane Fran and reviews how well or poorly traditional approaches to coastal hazards management have worked and whether public regulations have discouraged or encouraged redevelopment in high hazard coastal areas. The author reports that as of 1998, there has been extensive rebuilding of pre-Fran structures at a larger scale, but in some cases with greater safety from future storms through higher architectural elevation and setbacks along eroding shores. Such mitigation, however, has been required only for structures determined by local officials as substantially damaged. Some perceive that politics and generous federal disaster benefits have undermined the effectiveness of the state’s longstanding commitment to coastal hazard mitigation.

**Keywords:**
beach nourishment, economic modeling, flood damage, South Carolina

**Abstract:** This study offers a method for estimating the benefits to property owners from beach nourishment. The authors used a hedonic pricing model to estimate the increased protection value that wider beaches provide for single-family homes in two oceanfront communities in South Carolina. These benefits of reduced storm damages accrued not only for oceanfront property that suffers the most damage but also for properties farther back from the ocean. The authors find that a nourishment project proposed by the Army Corps of Engineers would produce approximately $63.8 million of cumulative benefits to owners of single-family houses, which translates into a cost-benefit ratio of 1.96.

environmental restoration, methodology, modeling, wetlands

**Abstract**: In the United States most flood-related analysis is based on the simulation of a small number of design events. This paper discusses the limitations of the use of design events to evaluate wetland restoration. For example, because design events are based on hydrologic modeling of discrete events rather than on continuous hydrologic modeling, they do not account for the prestorm water stored in the wetland system, for the wide variations that can occur in individual flood events in the spatial and temporal stormflow conveyance. The article outlines an alternative methodology for evaluating flood-mitigation benefits of specific restoration projects. Continuous simulation is an alternative approach that overcomes many of the drawbacks of design event methods.

**Keywords**: Cover America, marketing, risk communication

**Abstract**: FIA launched a significant public affairs program to prepare for a period of high flood potential. Elements of the program include a television spot, messages on snow melt, radio announcements, news conferences, and roundtable symposia to address questions from individuals living in areas where policy coverage has been sparse. Previously, FIA relied on its “Cover America” ad campaign and mini-conferences designed for the public, regional press, local and state officials, and lenders in major floodplains. FIA’s new approach couples public-based issues with industry concerns and includes devices from dispelling myths about flood insurance to offering commissions to insurers if they write policies on behalf of the federal government. The article also describes the Environmental Protection Agency’s public affairs campaign for its Superfund clean-up program for hazardous environmental sites. The EPA uses broadcast faxes, the Internet, hotlinks, and e-mail delivery of press releases to disseminate information about Superfund sites. In addition, community involvement coordinators at each Superfund site host local meetings, go door to door to talk to residents during emergency removals or long-term cleanups, set up community advisory groups, and make informational materials available.

**Keywords**: economic impacts, insurance premiums, pre-FIRM structures, property values, subsidies

**Abstract**: This study attempts to determine the number and types of properties nationwide that would be affected by reducing or eliminating subsidies for pre-FIRM structures and estimating the subsequent effects on premiums, participation in the NFIP, property values, and property tax revenue. The study undertook field surveys and data collection and reviewed seven different policy scenarios for elimination of the subsidy. Results suggest that eliminating a majority of the subsidy for pre-FIRM structures would increase the average annual premium for these structures from $585 to about $2000 within a year. Furthermore, if FEMA eliminated the subsidy immediately, the participation rate for pre-FIRM structures in SFHAs would likely decrease from 26 percent in 1997 to 20 percent in 1998, and then increase to about 29 percent in 2022. According to estimates, immediate elimination of the subsidy would decrease property values for
pre-FIRM, single-family structures by four percent in 1998 and property values of pre-FIRM, multiple family structures by seven percent in 1998. The higher property value declines associated with multiple family structures reflect that relatively higher concentrations of these structures are located in areas subject to coastal flooding.

Keywords: damage assessment, economic modeling, flood damage, repair costs

Abstract: The document is a critical review of existing knowledge regarding surveying flood damage to properties and estimating repairs. The authors identify a need for standardization of survey and repair estimation based on the experience of nearly identical flood damage occurring to nearly identical properties insured by different insurers, with different estimates of damage and repair costs. The enormity of annual flood damages means that the standardization of flood damage surveying and repair estimation techniques would be highly beneficial. The document highlights past research, but finds that previous models (i.e., cost-damage curves) measure costs, rather than the details of physical flood repair work and overgeneralize a complex issue. Subsequent additions to this body of work have focused on the impact of flood warning time and preparedness on the extent of flood damages. The document concludes that assessment of flood damage is currently prone to individual perceptions and previous attempts to quantify repair work provide little consideration of the flood itself.

Keywords: flood insurance, FEMA, North Dakota, Red River

Abstract: This article summarizes a survey by the Bureau of Governmental Affairs at the University of North Dakota among the homeowners in the Grand Forks area to find out why a large percentage of homeowners had not purchased flood insurance after warnings from various agencies that the area could be more prone to floods after the heavy winter snows of 1997. In April of 1997 Grand Forks experienced the worse flooding in history. The survey focused on homeowners who did and did not have insurance prior to the 1997 floods. In addition, respondents were questioned on whether they were required to have flood insurance by mortgage lenders, if not then what affected their decision to buy flood insurance and if flood insurance was not purchased what were the reasons. The survey also interprets data from the survey by demographics, age, family size, assessed value of home, and experiences with previous disasters. The article concludes that FEMA’s efforts to encourage homeowners to purchase a flood insurance policy were ineffective. Most of those that did purchase a policy did so based on what they saw happening with the increased flood potential in their area. It also finds that over a one-third of the uninsured residents made inquiries about purchasing a policy but then decided against it. Even though FEMA was encouraging residents to purchase flood insurance the National Weather Service was issuing conservative forecasts for flood potential. These findings were presented to the Flood Summit hasted by the North Dakota Insurance Department to learn from the mistakes of this disaster and to be able to prevent future ones.

**Keywords:**
awareness, insurance, risk perception

**Abstract:** The former NFIP coordinator for the state of Maryland says that flood insurance has failed because property owners think floods would not happen to them, and, even if insured, they often rebuild in the same flood-prone zones. The NFIP has proposed offering mitigation insurance, which would pay the owner of an insured, flood-damaged structure an additional settlement for mitigation measures to prevent and/or reduce future flood damage.

**Keywords:**
floodplain management, Midwest floods of 1993, Mississippi River, strategic planning

**Abstract:** The article summarizes of the Interagency Floodplain Management Review Committee’s Report to the Clinton Administration’s Floodplain Management Task Force. The author was a member of the committee, which proposed a better way to manage the nation’s floodplains. The report not only describes the nature and extent of the Midwest floods of 1993 and government efforts to cope with the event, but also presents a blueprint for change. This blueprint is directed at both the upper Mississippi River Basin and the nation as a whole. Its foundation is a sharing of responsibilities and accountability among all levels of government, business, and private citizens. It provides for a balance among the many competing river and floodplain uses; it recognizes, however, that all existing floodplain activity simply cannot be discarded as inappropriate. The committee believes that, if implemented, the recommended approach will bring about changes necessary to reduce flood vulnerability to both the infrequent major flood events and the more frequent smaller ones. Implementation also will reduce the environmental, social, and economic burdens imposed by current conditions on both public and private sectors. The committee’s report includes an action plan delineating proposed responsibilities and time lines for execution of recommendations, a fiscal impact statement, and the findings of the preliminary Scientific Assessment and Strategy Team’s report.

**Keywords:**
environmental protection, environmental restoration, floodplain management, Mississippi River, riverine areas

**Abstract:** Riverine habitats and ecosystems can be self-renewing and the integrity of an ecosystem can be effectively restored in the form of focus areas for aquatic habitat, aimed primarily at preserving native riverine species. Restoration and maintenance of habitats that simulate natural conditions are critical to the restoration and management of native aquatic species and may be the last best chance to address riverine endangered species needs. Specific features proposed by a floodplain management bill introduced by Montana Senator Max Baucus are described as critical to near-term aquatic ecosystem restoration in the Mississippi River Basin. Included are the following: (a) a comprehensive evaluation of the upper Mississippi River; (b) river basin management planning; (c) habitat projects and resource monitoring; (d)
congressional recognition of environmental and recreational resources; (e) environmental improvement; and (f) restoration of aquatic habitats.

**Keywords:** disaster assistance, economic modeling, federal programs, New York

**Abstract:** An economic analysis of alternative flood relief programs is presented based on the simulated flooding experience of the Binghamton, NY, metropolitan area. The theory of consumer choice under conditions of uncertainty is used to develop evaluation criteria for flood insurance and disaster loan programs, based on the benefits and costs of each program to both the public and the private sectors. A simulation model provides data for empirical implementation of the program analysis. The flood relief simulator is applied to a variety of possible assistance programs, including the NFIP and SBA’s Disaster Loan Program. Model results suggest that program designs cause substantial variations in costs, not only in terms of total outlay but also in the distribution of costs between the government and individuals.

**Keywords:** cost-benefit analysis, economic modeling, insurance purchase decision, subsidies

**Abstract:** This study examines the economics of alternative federal flood insurance and disaster loan programs, the distribution of program costs and benefits among public and private entities, and the effect of cost distribution on relocation decisions. The four alternative flood insurance and disaster loan programs evaluated were the regular and emergency flood insurance programs, the Small Business Administration’s disaster loan program, and a subsidized loan program of experimental design. The study finds that from a theoretical perspective, a property owner would prefer an unsubsidized insurance or loan program to no assistance at all. The study also analyzes the variability of flood disasters. Average annual flood damages in the study area were estimated at $1.1 million but the damages varied between the two-year flood at $197,000 and the 500-year flood at $57 million. The vast majority of damages were also concentrated in several categories of residential and commercial properties. The implication is that targeting these few classes of properties can greatly reduce flood costs. The study found that the added costs of flood insurance premiums to maintaining property were minor and would be unlikely to induce a property owner to relocate.

**Keywords:** disaster assistance, economic modeling, federal programs

**Abstract:** This study uses simulated data to perform an economic comparison between flood insurance and disaster loans. Disaster loans were the prevailing form of assistance in the 1950s, when SBA represented the primary source of federal aid. Results were inconclusive since they varied according to model assumptions. Variations in premium and interest rate subsidies had major effects on the distribution of total cost between the public and private sectors.
Keywords:  
California, compliance, development  
Abstract: The authors analyze the expected economic repercussions during the period 1992-2005 of new construction standards and flood insurance requirements on 10 cities in Los Angeles County’s floodplain. The authors looked at three variables they felt may cause adverse local and regional economic impact: deferred construction, higher costs associated with compliance requirements for development, and flood insurance premiums that may drain resources from other forms of spending (offset in part, by a stimulus to the insurance industry). The authors surmise that the program will significantly discourage development in the floodplain. They conclude that floodplain location and the insurance requirements have massive, adverse economic impacts on the 10 cities studied.

Keywords:  
development, subsidies  
Abstract: The author contends that the Midwest floods of 1993 demonstrate the self-defeating nature of the federal government’s handling of natural disasters and that federal policies subsidize the cost of living in risky areas such as floodplains. The NFIP runs a deficit, has not constricted coastal development, and pays a third of its payments to 3 percent of claimants. While federal officials and the insurance industry maintain that floods are not an insurable risk, some private, though expensive, policies are available. Deregulated private insurance is an alternative. Some insurers defend the NFIP because they make money but incur no risk by selling policies. Massachusetts Senator John Kerry introduced S. 1405, which would prohibit new federal insurance policies in high-risk erosion areas. However, this bill would perversely expand federal control and violate property rights. The author believes that citizens should be free to do what they wish with their property and should accept the consequences.

Keywords:  
California, environmental restoration, flood control, urban areas  
Abstract: Local flood-control projects along streams and rivers have long been dominated by designs that use concrete and hydraulic engineering that is rectilinear and non-ecological. However, an urban flood-control project may be designed to restore natural habitat and enhance the environment while reducing the threat from floods. The thirty-six year history of planning for the Wildcat and San Pablo Creeks in North Richmond, CA, may result in an environmentally sensitive flood control project if the current design is successfully implemented and managed over time. This experience offers many lessons for similar projects elsewhere.

Keywords: environmental protection, flood control

Abstract: The chairman of the Upper Mississippi Flood Control Association (UMFCA) writes that flood control is the cornerstone of a river transportation infrastructure that permits navigation, economic development, and environmental and social stability. The current environmental challenge is to find a way to provide for all four of these essential parts in a compatible way without destroying or preventing future enhancement and development of any of the others. The challenge is further complicated by pro-environmental politics and financial reality. The UMFCA remains a strong supporter of navigation improvements, the continued protection of private property, economic development, and environmental protection. It believes that the balanced system of flood control and natural flooding areas, now in place, along the navigable rivers is the best environmental and wildlife producing system that has ever existed.

Keywords: Canada, economic impacts, floodplain management, mitigation, Quebec

Abstract: This study assesses the effectiveness of two flood damage reduction measures -- designation and diking of floodplains. The study was carried out in four Quebec municipalities located on the shores of Lac des Deux-Montagnes and Rivière des Mille-Iles, namely Sainte-Marthe-sur-le-Lac, Saint-Eustache, Rosemère, and Bois-des-Filion. Criteria for selecting the study areas included area of the flood-risk zone, presence or absence of dikes, presence or absence of buildings, and availability of data. The study areas were selected with the help of flood risk maps of the Greater Montreal region. In each area, information on the number of buildings and their economic value was taken from the municipality’s property assessment database. Trends in the occupancy and value of floodplains were identified and compared. The results of the study show that, as in other regions of Canada, measures to reduce flood damage based on designation and mapping of floodplains have had no impact on occupancy, have failed to reduce flood damages, and have not halted increases in such damages.

Keywords: building codes, development, NFIP, wetlands

Abstract: Robinson identifies six points that are important in any discussion of the impact of the NFIP in development (a) because new construction is actuarially rated, there is no insurance “subsidy” for property that was not already in place when the community was first mapped; (b) added costs associated with NFIP building standards and insurance premiums should discourage floodplain development provided that alternative flood free locations are available; (c) in a few
instances, the NFIP may “enable” development by making lenders more willing to loan or invest in development. However, given the added costs associated with the NFIP’s building standards, this would most likely occur only when the proposed development has high recreational value or where undeveloped flood free property is scarce; (d) wetland losses are primarily due to agricultural and commercial or industrial development neither of which are affected by the availability of flood insurance; (e) the NFIP’s requirement that communities designate a regulatory floodway and prohibit development within that floodway that would cause any increase in flood heights provides significant protection to river corridors; and (f) the NFIP’s building standards improve the overall quality of development when it does occur. Empirical evidence, according to the author, does not support a conclusion that flood insurance is critical to coastal development.

**Keywords:**
disaster assistance, public assistance

**Abstract:** Federal relief for local governments following natural disasters is provided under the assumption that without aid disasters might overwhelm local resources thus slowing recovery. Using loss data for a sample of counties experiencing disasters in the mid-1980s, this paper provides evidence that the financial condition of local governments was not improved by receiving federal aid. Additionally, the paper shows that the initial financial impacts of disasters may be negative, but that within two years the net effect is positive.

**Keywords:**
flood control, history, urban areas

**Abstract:** This book summarizes the proceedings of the National Symposium, Flood Control Challenge: Past, Present, and Future held on September 26, 1986. This symposium commemorated the fiftieth anniversary of the 1936 Flood Control Act and was sponsored by the Public Works Historical Society and the Army Corps of Engineers in cooperation with the American Public Works Association’s Institute of Water Resources and Council on Emergency Management. The proceedings are arranged in three parts; Part I: The 1936 Flood Control Act, Part II: Impact on Rural and Urban Areas, and Part III: The Economics of Flood Control. Chapters of particular interest are: “Evolution and Future of Flood Control,” by T.M. Schad; “Flood Control in Urban Areas: Past, Present, and Future,” by B. Steinberg; and “When May a Post-Audit Teach Lessons?” by Gilbert F. White.

**Keywords:**
history, NFIP

**Abstract:** This dissertation analyzes the historical development and present workings of the NFIP. The NFIP is the result of the federal government’s continued involvement in flood control, which dates back to the early 1800s. The NFIP is a response to the inability of structural
measures to prevent increases in flood damages. Historical data were analyzed for themes and sensitizing concepts which were then used to guide the second stage of data gathering using field work based on interviews, observations of public and private meetings, and current periodicals. This primary data were analyzed using the themes, sensitizing concepts, and Jurgen Habermas’s theoretical work on late capitalism. The case demonstrated problems of rational administration, economics, and legitimation as the federal government has implemented the NFIP.

floodplain management, mitigation, risk perception

**Abstract:** As the risk reduction community seeks to harness resources and mold them into effective mitigation programs, communication and understanding among stakeholders are more critical than ever. The insurance industry has a long history of loss-prevention successes and is applying this experience to the mitigation of natural disaster losses. While most stakeholders are familiar with insurance coverage, relatively few understand what drives the industry and what its unique tools, obstacles, and issues are in relation to natural disasters. The research finds that natural disasters are generally perceived as a distant threat, but that perceptions vary with insurance coverage: consumers who have flood insurance see floods as being more likely than consumers without flood insurance (65 percent vs. 40 percent). This paper offers an insider’s view of the industry’s approach to mitigation, focusing on why mitigation is important to this business sector, what the industry is doing to promote preparedness, what some of the obstacles are in its work, and how it can better prepare itself for the challenges ahead.

**Keywords:**  
Alabama, Coastal Barrier Resources Act, coastal barriers, development, environmental policy, Florida, North Carolina, public policy, South Carolina, subsidies

**Abstract:** This report evaluates the impact of the Coastal Barrier Resources Act (CBRA) on development in coastal barriers and has three objectives: to determine whether the availability of federal funds encourages construction in coastal areas; to determine whether restrictions under CBRA have been adhered to by the federal government; and to determine what would be the real, unsubsidized cost of coastal development, i.e., the added cost of development when developers have to pay for private roads, water and sewer systems, insurance, and/or bridges. The report discusses the act’s purposes and history, reviews the relevant literature, and provides both a qualitative (case studies) and quantitative analysis of CBRA’s impact. To conduct the evaluation, the authors visited coastal barriers in four states—Alabama, Florida, North Carolina, and South Carolina. At each site, the authors conducted interviews with key stakeholders and selected a random sample of parcels from CBRS and non-CBRS areas. In addition, where possible, the authors estimated the total number of dwellings, single-family houses, and condominiums constructed since the adoption of the act. Overall, the report makes several
important conclusions: 1) where state and local government actions and policies support the objectives of CBRA, little or no development occurred in the CBRS unit; 2) state and local government subsidies were often substituted for federal subsidies, thus undermining the intent of CBRA; 3) infrastructure investment by the private sector has enabled development to occur in CBRS units; and 4) in the areas sampled, parcels in CBRS were less likely to be developed than parcels in non-CBRS areas within the same coastal barrier.

Abstract: Using five case studies of selected Coastal Barrier Resources System (CBRS) units as well as surveys of state coastal managers and key informants, the author asked (a) the extent to which the Coastal Barrier Resources Act (CBRA) has limited development in CBRS units, (b) the ways in which policies and actions of state and local governments affect the development of CBRS units, and (c) the extent to which advocacy coalitions account for the difference in the level of development among certain CBRS units. Salvesen concludes that CBRA, by itself, will not prevent development from occurring in CBRA-designated areas. In fact, it appears that development in CBRS units will occur if development pressure is strong enough to overcome the disincentives posed by CBRA and state and local governments facilitate development in CBRS units. On coastal barriers that are readily accessible, where the real estate market is strong, and where most of the non-CBRS units have already been developed, CBRA may only be delaying the inevitable. However, government policies and advocacy coalitions can play a crucial role in shaping development in CBRS units. The paper suggests the following policy revisions: (a) ensure that federal agency actions are consistent with the act’s objectives should be delegated to a single agency, (b) appoint an official arbiter for interagency disputes, (c) incorporate the CBRA’s goals into local coastal zone management plans, (d) improve outreach, and (e) limit federal spending for infrastructure on coastal barriers if it will encourage development in a CBRS unit.

Abstract: While it is obvious disasters are negative events causing injury and death, damage, and destruction, macroeconomic studies show little long-term economic effects from disaster. That is because disasters create both losers and winners, which balance out. Who loses and who wins is not random but a result of public policy decisions. The losers include individuals who are injured, lose their jobs, lose their homes, lose a wage earner, or lose a place of residence. The winners include individuals who earn extra money because they are involved in emergency response or restoration. They include wage earners and their families as well as some businesses, but not others. They include communities that, because of substantial assistance, end up better off because of the disaster. Winners and losers are created by decisions about where to build a dam or who should receive what sort of assistance. This article is not based on new research but on an analysis of existing material. The author concludes that more research is needed on the
economic effects on individuals, businesses and communities, and on the economic impact of policy decisions.

**Keywords:**
Canada, economic modeling, floodplain designation, Ontario, property values, socioeconomic impacts, urban areas

**Abstract:** This study investigates the effect of floodplain designation and regulations on residential property values in an established residential neighborhood on the Don River in North York, Ontario. This area was designated under the National Flood Damage Reduction (FDR) Program in 1982, and adopted as a Special Policy Area (SPA) in 1984. Various forms of a hedonic regression price model are utilized to identify the influence of designation/regulations on selling price. The model employs individual property attribute data, available through the Multiple Listing Service. A preliminary model indicates that location and designation/SPA formulation contribute minimally to sale price. Conversely, under the land comparison technique, designation moderately depresses and SPA regulations positively influence property values. Overall, the results are mixed, inconclusive, and highly dependent on the specific analytical model.

**Keywords:**
development, urban areas

**Abstract:** This study evaluates both the amount of floodplain in urban areas and the degree of development of these floodplains for 26 communities in the United States. The amount of urban area in floodplains ranges from 2.4 percent in Spokane, WA, to 81 percent for Monroe, LA. The median value is 10.5 percent, and the weighted average is 16.2 percent. The amount of development on these floodplains also varies widely, from 11.3 percent for Lorain-Elyria, OH, to 97 percent for Great Falls, MT. The median value is 57 percent, and the weighted average is 52.8 percent. Attempts to correlate either the extent of urban area in floodplain or amount of development with three readily available indices—depth of flooding, precipitation, and physiography—showed no strong relationships. Some correlation was found between the extent of urban area in floodplain and index depth of flooding.

**Keywords:**
agriculture, environmental protection, Hurricane Floyd, North Carolina

**Abstract:** This article discusses the regulatory and policy implications for the swine industry in North Carolina in the aftermath of Hurricane Floyd. The swine industry was responsible for most of the flood-related environmental damage sustained during Hurricane Floyd. As part of an emergency waste-management plan, waste-management systems that sustained more than 50 percent damage will not be permitted to rebuild in the 1 percent annual chance floodplain.
Environmentalists and others contend that a massive hog farm should not be located in a low-lying area that is vulnerable to flooding and ecologically sensitive, but state officials are unwilling to provide any definitive answers as to whether regulatory changes to swine farming will ensue to accommodate future flood conditions.

Keywords: disaster assistance, disaster planning, flood disaster planning, hazard identification, Midwest floods of 1993, mitigation, natural disasters, risk assessment

Abstract: FEMA provided funding for this report and asked the American Planning Association (APA) to write and publish it as a form of outreach to the planning community. The document can help community leaders and planners educate their constituents on how informed decisions and choices can affect the rebuilding process and yield a safer, more sustainable community. The report introduces planners to their roles in post-disaster reconstruction and recovery, and provides guidance on how to plan for post-disaster reconstruction side by side with all the other players involved (city/county managers, business owners, and others). A key theme throughout this report, and one that should be equal in importance to community recovery, is the need to rebuild in such a way as to create a community that is more resistant to future disasters. Hazard mitigation is crucial to the long-term sustainability of communities, and therefore must be considered as important as other traditional planning considerations when making development decisions. This report is essentially divided into two parts. How-to information is presented in the first, and background information, cases studies, and appendices are presented in the second.

Keywords: Germany, insurance coverage, mandatory purchase

Abstract: The presentation describes the state of German flood damage and the response of flood insurance to reducing costs. The number of flood disasters worldwide in the 1990s was more than four times the number of flood disasters in the 1950s. Damages – insured and uninsured – have risen tremendously over the past half century. The author estimates that infrastructure damage accounts for 40 percent of total flood damages, followed by agriculture and forestry (22 percent), and private households (20 percent). Flood insurance has become an increasingly less viable option because of higher than expected losses, rapidly increasing premiums, rising deductibles, and added risk factors. All of these factors have resulted in the withdrawal of coverage. The demand for flood insurance has decreased as well. The presentation outlines the components of a mandatory purchase program and examines the differences between French and German reinsurance pools.

**Keywords:** development, flood control, floodplain management, risk assessment

**Abstract:** Many parts of Scotland are at risk of flooding due to watercourses, proximity to the ocean, groundwater, and inadequate drainage. Experts predict that climate change will worsen the situation in the future. The Scottish Executive expects developers and planning authorities to err on the side of caution in decision-making whenever flooding is possible. For instance, new development should not take place if it would be at significant risk of flooding or would materially increase the probability of flooding elsewhere. The document insists that the storage capacity of functional floodplains should be safeguarded: namely, elevation of the level of a site should not lead to a reduction in storage capacity. The guidance states that redevelopment of brownfield sites in developed areas with flood defenses is acceptable. However, developers should be cautioned that greenfield proposals will extend the area of built development at risk and water-resistant materials and forms of construction may be required. The guidance states that sustainable drainage will be required whenever practicable and that watercourses should not be culverted. In general, developers should take drainage characteristics into account when planning a structure. Flood prevention and alleviation measures should respect environmental concerns and the characteristics of the flood hazard.

**Keywords:** risk communication, risk perception, Louisiana, media, Mississippi River

**Abstract:** The literature on environmental hazards suggests that media reports constitute a major source of information on which people base their responses. However, the effect of media reports on responses is neither direct nor simple. Variables such as prior experience, the responses of others, selectivity in attention, and characteristics of the content of media reports interact to influence responses. On the basis of the extant literature on media and hazards, the authors constructed a model of the effect of media reports on the public’s response to a natural hazard event. The authors test various hypotheses derived from this model by examining a salt water intrusion in the Mississippi River that affected drinking water in the New Orleans metropolitan area in the summer of 1988. Using time series analysis, the article examines the effect of various characteristics of local newspaper stories on bottled water sales throughout the intrusion period. The results suggest that in the absence of personal experience, people are more likely to respond to media reports regardless of personal relevance or seriousness of the consequences of the hazard events reported by the media. When people possess personal experience, they are more selective in their attention and response to media reports. The results also suggest that people used media reports of others’ behaviors as cues to appropriate responses. Finally, the report concludes with a discussion of the conceptual and methodological implications of these results for future research.

**Keywords:** economic modeling, nonstructural approaches, property values, risk perception, socioeconomic impacts, structural approaches, Virginia, zoning

**Abstract:** This paper reports on the results of an investigation of the hypothesis that the existence of flooding has a detrimental effect on residential land values. No reason was found to reject this hypothesis. The hypothesis that structural measures (flood control) enhance property values was not rejected although the evidence was limited to one case study. Finally, attempts to assess the hypothesis that nonstructural measures like zoning depress property values were not conclusive. The results also suggest some possible general conclusions. In the case of Radford, VA, the estimated equations suggest that the elimination of flood risk is something that ultimately gets built into prices in a uniform way. However, the inability to develop a strong explanatory regression equation for sales of land in the floodplain in Alexandria, VA, suggests a high degree of unexplained variation in sale prices. Such variability may actually stem from purchasers’ ignorance of the flood risk in the area or from a difference in the willingness to take such risks, although the results show that average sale prices are lower in the floodplain than in comparable flood-free areas. Thus, the removal of uncertainty has a predictable effect on price.

**Keywords:** attitudes, flood control, Virginia

**Abstract:** Voting behavior in a referendum on flood control in Roanoke, VA, provides evidence that people living and working outside the flood-prone area are willing to pay for the construction of flood control projects. This voting behavior supports the argument that flood control benefits exist at the community level. In providing the cost sharing required under recent federal legislation, local government financing that distributes project costs over the whole population of a local jurisdiction, and not just those persons living or working in protected areas, may increase both economic efficiency and expand communities’ financial capacity to pay for such projects.

**Keywords:** environmental restoration, public policy, wetlands

**Abstract:** This article takes a critical perspective on the restoration of floodplains. It describes how the nation’s goals for its wetlands and floodplains have changed over time from development to preservation and, now, to ecosystem restoration. It states that effective policy analysis must go beyond the easy rhetoric of saying that the 1993 flood revealed “failed policies.” Analyses must demonstrate that continued agricultural land use imposes costs that are
greater than their values, and that the society is willing and able to implement policies to restore the lands. It comments on analytic and financing challenges for advancing a national restoration agenda and concludes that the policy question posed by the 1993 flood is whether the nation wishes to reverse the long standing policies that have encouraged the occupancy of floodplains and the drainage of wetlands and pursue a restoration agenda.

**Keywords:**
cost-benefit analysis, economic modeling, property values, public policy

**Abstract:** This paper contrasts the results of the valuation techniques of contingent valuation, hedonic price, and property damages avoided. Each technique was used to estimate the value of flood risk reduction from the construction of a flood control project. Voting behavior in a referendum called specifically for the provision of the project was used to further interpret the results from the three valuation studies. The authors found substantial differences between the estimates. The authors suggest economists should apply the estimation technique that best facilitates a collective choice process. An acceptable benefit estimation technique does not have to measure all possible effects in direct accord with theoretical willingness-to-pay logic, instead the decision-participants must believe that the estimate reflects some salient feature of a choice. It also means that the estimate needs to be understood to those who might use it. For instance, the Property Damages Avoided (PDA) technique could be a useful benefit estimation technique for a variety of reasons (understandable logic and limitations), none of which is based on the argument that it is an accurate or comprehensive measure of the benefits of flood control. In contrast, while contingent valuation methods (CVM) are theoretically capable of establishing the willingness-to-pay for the entire range of environmental use, CVM may provide little useful policy information, sometimes even generating more controversy than application in decision-making. The authors conclude that to be effective in public policy, economists have to become more attentive to what techniques, advice, and analyses are useful to those involved in making choices. Policy economists will be ineffective if they cling to the notion that there exists a “correct” benefit estimate and that their professional responsibility is to measure it under any circumstances.

**Keywords:**
development, Hurricane Beulah, subsidies, Texas, wind

**Abstract:** This study provides a chronology of events that influenced a surge of development in the most southern portions of Padre Island, TX. The availability of flood insurance is one of several factors identified in the growth of neighboring communities. At about the same time as the NFIP was enacted, the state legislature created the Texas Catastrophe Property Insurance Association (now known as the Texas Windstorm Insurance Association), which guaranteed windstorm and hail insurance to Texas coastal communities. Of the two programs, the windstorm pool coverage clearly presented the largest exposure. Also, the authors said that another large influence on development came in 1967 during the aftermath of Hurricane Beulah. This hurricane destroyed mostly substandard structures, clearing the way (literally) for more storm-
proof development. The authors conclude that while the NFIP represented the first occurrence of federal subsidization of development in South Padre Island, the impact of the availability of flood insurance is difficult to discriminate from the impact of the availability of wind and hail insurance and the impact of Hurricane Beulah.

**Keywords:**
coastal barriers, development, property values

**Abstract:** This report focuses on the impact of public land acquisition on land values on adjacent barrier islands and mainland communities. To address the topic, the authors select and analyze four seashores on the southeast Atlantic and Gulf Coasts. The report found that increases in real estate values in communities adjacent to the seashores were not determinable. Also, convenient access by road, bridge, or causeway did not immediately lead in every case to extensive development in the adjacent community. In all of the case studies, initial development of road access was financed by private, local, and state interests. Federal participation came later. Wastewater management and freshwater supply were among the major constraints on further development. Acquisition costs of the seashores studied ranged from $75.35 to $4,950 per acre. However, even using an average purchase price of $5,000 per acre, acquisition costs could be one-fifth or less of the costs to the federal government of continuing current development programs on the undeveloped barrier islands. Cost-effectiveness will be maximized if public acquisition occurs before development, if possible. The report concludes that public acquisition of the islands is cost effective and the surest means to protect barrier islands from inappropriate development.

**Keywords:**
Community Rating System, development, economic impacts, environmental impacts, environmental policy, flood control, floodplain management, NFIP, public policy, zoning

**Abstract:** This article describes how market-based incentives can encourage private interests to implement sustainable development and ultimately achieve wise use of floodplains. After explaining the evolution of flood control policies and why these traditional approaches have failed, the authors discuss the need for a broader understanding of the wise use of floodplains. This approach emphasizes the economic, social, and environmental benefits of multipurpose floodplain management as well as the costs of correcting past mistakes of land-use. Market-based incentives can be incorporated into overall floodplain management efforts to help create a more multipurpose approach and to attain the goal of wise use. An incentives-based approach to floodplain management seeks to identify relationships among regional and environmental factors and to incorporate solutions of multiple economic and environmental benefits. Development credits represent one way to incorporate market-based incentives into floodplain management. For example, the public benefits associated with the wise use of floodplains can be credited to owners and developers by allowing them to build more housing units in a development in an appropriate area. The authors then discuss examples of current programs and projects using incentives including CRS.

**Keywords**: floodproofing, mitigation, nonstructural approaches, structural approaches

**Abstract**: Floodproofing consists of those techniques for preventing flood damage to a structure and the contents of a building in an area subject to flood hazards. This publication is intended to acquaint public officials, building owners, and professionals with the essential principles and to outline and illustrate simple but effective measures for reducing the damages caused by flooding. The report can serve as an outline for engineers, architects, and other professionals of the problems associated with either preventing entry of water into buildings or minimizing the damages from flooding. Chapter topics include the uses and limitations of floodproofing, the physical environment and types of floodproofing, procedures for floodproofing, structural engineering aspects of floodproofing, and programs of floodproofing.

**Keywords**: Midwest floods of 1993, 1 percent annual chance flood standard, property values

**Abstract**: This article says that the Midwest floods of 1993 “caught many business executives off guard – unaware of the flooding danger, the need for flood insurance, or what steps they should take in a flood emergency.” The author takes exception with the use of the term “100-year floodplain” saying it is misleading and creates a false sense of security. While it is difficult to quantify the effect of flood or fear of flooding on the real estate market, property values take a “major hit” after a flood. According to the author, it would take rebuilding levees to the 500-year floodplain level to reinstate market values of land to the levels prior to the Great Flood.

**Keywords**: economic modeling, Louisiana, pre-FIRM structures, property values, subsidies, urban areas

**Abstract**: This paper examines the economics of the wealth transfer created by the NFIP. By its very nature, the NFIP is unique in that it subsidizes existing properties but not new construction. Thus for comparable properties, the gain captured by existing homeowners is the difference between selling prices of equivalent qualified and nonqualified properties. Using standard hedonic pricing models, the authors empirically test the impact of subsidized and nonsubsidized flood insurance on property values in Baton Rouge, L.A. Results demonstrate that floodplain location causes a significant discount on properties eligible for subsidized flood insurance. This wealth redistribution simply adds to the total cost of transferring subsidized housing units.

**Keywords**: 
attitudes, awareness, buyouts, development, economic impacts, environmental impacts, flood control, flood damage, floodplain management, insurance purchase decision, levees, mapping, Midwest floods of 1993, Missouri, NFIP, 1 percent annual chance flood standard, public policy, risk perception, Special Flood Hazard Areas, zoning

Abstract: This article addresses concerns about a lack of state oversight of floodplain development in communities. Missouri, like about 20 other states, does not have a statewide floodplain management program, but instead relies on communities to voluntarily participate in the NFIP and adopt the program’s standards. The article quotes representatives from organizations such as the Missouri Coalition for the Environment and the Great Rivers Habitat Alliance, which are critical of what they see as inadequate management of the state’s floodplains. The article points to other states that use regulations to control floodplain development. Some states mandate local participation in the NFIP, oversee levee construction, formulate policy based on anticipated or future development, and require standards that exceed those required by the NFIP such as freeboard or wider floodways. The article is part of a series of more than 20 articles published by The St. Louis Post-Dispatch in July 2003 to examine the state of areas affected by the Midwest floods of 1993. Other articles address construction removed from the floodplain by levees, programs to buyout properties in the floodplain, increased development within the floodplain, and perception of flood risk.

Keywords: buyouts, Maryland, repetitive losses

Abstract: The article highlights an analysis of FEMA data regarding repetitive loss properties in Maryland. Maryland had 299 repetitive flood losses over a 10-year period with Worcester, Baltimore, and Washington counties reporting the most. Taxpayers typically pay for disaster assistance when flood occurs outside a mapped flood-zone area and the property is uninsured, or when a federal disaster is declared. Increased development has created new flood-prone areas not listed on outdated maps. FEMA is trying to mitigate the most egregious repetitive loss cases, primarily through buyouts. Since 1996, Maryland has had more than 360 buyout projects.

Available at: http://www.sierraclub.org/wetlands/reports/flooding/

Keywords: Army Corps of Engineers, environmental protection, flood control, flood damage, mitigation, permits, wetlands

Abstract: This report shows that floodplain sprawl and wetland destruction are causing more flood deaths and damage across the country. According to the Sierra Club, the Army Corps of Engineers approved 99 percent of developers’ requests between 1988 and 1996 for permits to destroy wetlands. This rate of approval occurred even in states with high flood risks. Floods killed 957 and destroyed $45-90 billion in property from 1989 to 1998. North Dakota leads the nation with 15 counties declared disaster areas five times between 1989 and 1998. King County, WA, and Jefferson County, IN, had flood disasters on seven separate occasions. The report also
shows that “rubber stamp” wetland permits allows developers to build on and destroy 78,000 acres of wetlands, enough to store 78 billion gallons of floodwater or about 24,000 flood control dams, between 1988 and 1996. Meanwhile, FEMA and state agencies paid $500 million to move more than 17,000 residential and commercial structures out of floodplains after floods between 1988 and 1998. Data from the Army Corps of Engineers show that 40 percent of the destruction of wetlands from 1988 to 1996 occurred with Nationwide Permit 26, which allows developers to destroy up to three acres of isolated wetlands.

**Keywords:** coastal barriers, development, environmental impacts, environmental policy, federal programs

**Abstract:** This paper focuses on the often unintended consequences of federal development and grant programs by a number of agencies on barrier islands. There are about 300 barrier islands and spits containing roughly 1,605,000 acres in the United States, varying from units of 50 acres to islands of more than 100,000 acres. The author describes barrier islands as environmentally and economically important. Many barrier islands contain significant urban settlements, including such population centers as Virginia Beach and Miami Beach. Barrier islands also experience a high rate of urbanization, roughly three to four times faster than the mainland.

Moreover, the national stock of undeveloped barrier islands – 480,000 acres – has tremendous development potential that will be affected by federal programs. The author’s concludes that a number of federal programs encourage – or at least, do not discourage – settlement of barrier islands. In its actions, the federal government presumes a right for citizen to settle wherever they please. The author states that many of the federal programs were established with no regard for their effect on barrier islands, and that today many people can afford to settle on barrier islands only because of conditions created by federal programs. For example, the federal flood insurance program was created to cover risks that are unacceptable in the private insurance market. The author likens the program to crop insurance for real estate brokers and mortgage lenders. The author also identifies EPA grants for public wastewater treatment as among the catalysts for expanding barrier island settlement. The report’s contention is that the confluence of effects of disparate federal programs is increasing urbanization on barrier islands and decreasing the risks of locating there. He sees this as a consequence of a bureaucratic system consisting of agencies whose mandates are remote from barrier island issues, yet which affect islands substantially.

**Keywords:** mitigation, Texas, wind

**Abstract:** This paper explores the value of windstorm mitigation in a city on the Gulf Coast. Policymakers have long assumed that agents will not voluntarily mitigate for a natural disaster. Consequently, policy has focused on coercive measures. The study contains detailed information on the inclusion of storm-blinds, a specific hurricane mitigation feature. Homes with storm-blinds command a premium compared to homes without this feature, thereby questioning the assumption held by policymakers. This result, however, is limited to homes located on the island portion of the community indicating that agents differentiate the risk from one area to another.

**Keywords:**
coastal areas, coastal barriers, development, NFIP

**Abstract:** This brief overview of the NFIP explains that one of the more volatile issues for the NFIP has been whether it should provide any form of incentive for development of coastal barriers. It became apparent to Congress that a variety of factors were producing growing pressure for the development of these fragile areas. These factors not only included construction of infrastructure but also the availability of flood insurance through the NFIP. Eliminating the availability of federal flood insurance for new construction in these areas would remove one of these incentives to develop.

**Keywords:**
legal issues and litigation, NFIP, takings

**Abstract:** The author examines the potential impact of U.S. Supreme Court rulings on the constitutionality of the NFIP. Between early 1987 and 1990, the Supreme Court decided three important cases involving the key question of what constitutes a taking of interests in real property under the Constitution. The author discusses the Fifth Amendment debate over the NFIP’s takings clause, the nature and extent of flood hazards in the United States, and a brief history of the NFIP. The author concludes that there are few “new” practical results emerging from the Supreme Court’s “takings trilogy” of 1987 that impact on the NFIP. As the result of the takings trilogy, it is expected that the courts will scrutinize more closely both the regulatory purpose underlying laws affecting land use and the nexus relationship of statutes to purported regulatory goals. However, the NFIP has little cause for the constitutional fear engendered in some circles by the three decisions. Considering the hundreds of flood hazard-related land-use regulations upheld by the courts compared to the handful of those overturned, it is more than likely that the courts will continue to sustain soundly conceived and fairly administered floodplain regulations and loss-mitigation statutes.

**Keywords:**
economic modeling, housing markets, insurance, property values, subsidies, Texas, urban areas

**Abstract:** This paper provides evidence about the pricing efficiency of residential real estate markets by comparing home prices before and after a flood for two contiguous locations—a flooded and an unflooded (control) subdivision in Houston, TX. If the flood conveys the initial signal that the subdivision is flood-prone, then an efficient market will depress prices with no subsequent recovery. In contrast, if the flood simply confirms a recognized fact, no price response will ensue. Alternatively, as maintained by local real estate professionals, prices in the
flooded subdivision will decline immediately after the flood. Then, as the market forgets the flood, prices gradually rise to original levels. This latter sort of price behavior is patently inefficient. The findings indicate that prices in the flooded subdivision do not decline relative to the local market immediately after the flood. Apparently the information conveyed by the event is already reflected in home prices. However, when insurance rates increase markedly approximately one year later, the higher rates are capitalized into home values and prices fall. This evidence is consistent with market efficiency.

Keywords: insurance purchase decision, risk perception

Abstract: The report documents the results of a series of laboratory experiments. The experiments measured the likelihood that participants would purchase insurance for specified hazards with varying probabilities and outcome costs. Results indicated that people are less likely to insure against relatively unlikely hazards with high outcome costs. Conversely, people showed more willingness to purchase insurance against hazards that had a high probability of occurrence, even if the outcome costs from such hazards were low. Thus the probability of an event occurring seems to be given greater weight in the decision making process than the possible outcome of the event. This conclusion has obvious implications for natural hazard and flood insurance.

Keywords: Hurricane Hugo, risk communication, South Carolina, weather

Abstract: The federally supported state climatologist program ended in 1972. Thereafter, most states supported these endeavors in coordination with the National Climatic Data Center, but the current state programs vary widely. One of the functions of state climate programs that evolved since 1972 is acting as a liaison between the National Weather Service and various state agencies. This role was most apparent and controversial in coordinating state and local government response to severe weather and extreme climate anomalies such as droughts, floods, winter storms, and tropical cyclones. The activities of the climate office in South Carolina during Hurricane Hugo in September 1989 and the October 1990 floods revealed how these interactions occur in one state that mandated these activities. The state climate office had to react to shifting weather conditions and to variable political conditions that affect public organizations. The climate office in South Carolina acts to interpret weather information, develop scenarios and predictions, and assist in post-event damage surveys. This review acknowledges and documents the expanding role of the state climate office in South Carolina in response to state and local government needs for weather forecast interpretation and expert guidance in the event of severe weather.

Abstract: The last decade has seen the first tentative steps to assess the socio-economic impacts of greenhouse-induced climates on communities. This article estimates possible flood damages for three flood prone urban communities in Australia using climate change scenarios adopted by the Intergovernmental Panel on Climate Change (IPCC) in 1996. According to the models, all three locations would see a marked increase in the average annual direct flood damage under the worst-case scenario (doubling of present-day CO2 levels). Furthermore, more frequent flooding could potentially cause a sharp increase in the number of flood prone structures. In response to these estimates, the authors discuss two possible approaches to greenhouse policy: the “no regrets” option and the “precautionary principle.” The “no regrets” option can be regarded as measures worth doing anyway, whereas the “precautionary principle” can be regarded as additional investment that would not have otherwise been invested. The authors recommend policy changes based on the “no regrets” and “precautionary principle” despite the uncertainties and lack of local detail in the greenhouse scenarios and the problems of estimating the frequency of extreme events.

Abstract: The paper presents a study of the effect of risk perceptions of property owners on housing prices in Florida before and after Hurricane Andrew. The study compares home sales in Dade County, which suffered the majority of Andrew’s damages and Lee County, which was close to the hurricane’s landfall, but suffered no structural damage. The study finds that housing prices in Dade County fell between 20 and 30 percent, while housing prices in Lee County fell an average of 19 percent. The difference between counties intends to isolate the “information effects” of the hurricane – the change in housing prices as a result of increased awareness of the potential of a major disaster. The analysis distinguishes between models that include the effects of time on housing price and those that do not. Further research of the dynamic between risk perception and time from a natural disaster is recommended.

Keywords:
Abstract: The paper presents the results of surveyor responses regarding flood characteristics as part of a two-year project to benchmark the assessment of flood-damaged properties in the United Kingdom. The research is based on the principle that flood damage is the function of flood characteristics and property characteristics. A review of previous research finds that little or no consideration is given to the characteristics of a flood when assessing flood-damaged properties. The survey finds that individual perceptions play a large role in damage estimation. The report recommends definitive guidance to minimize variations in claims and repair estimates.

Keywords: economic modeling, flood control, Kentucky, property values, urban areas

Abstract: Measuring flood control benefits from estimated property damage in prior floods omits losses in the form of depressed values of land put to less valuable uses because of annual flooding. Covariance analysis of real property values in three urban areas differently situated around Lake Cumberland, KY, shows a much larger rate of increase, over a 15-year period, for the area receiving flood protection. This result suggests that the economic benefits from a flood protection facility (dam) include these additional property value increases as well as the prevented property damage.

Keywords: agriculture, cost-benefit analysis, environmental restoration, floodplain management, Mississippi River, riverine areas

Abstract: This article focuses on the proposals for an aquatic ecosystem restoration of the floodplains in the United States. It offers an alternative to rebuilding of agricultural levees and discusses the restoration of the natural services of floodplains. It reviews the modification of federal programs to protect life, property, and the improvement of the ecosystems of the Upper Mississippi River. The article suggests that although floodplain agriculture may be profitable from a farmer’s perspective, no one really knows whether it is sustainable and cost-efficient from a national perspective. The article questions whether it is necessary to subsidize flood protection on flood-prone lands and irrigation on arid lands when production is so high on prime farmland with more moderate moisture conditions that farmers are paid not to grow crops. According to the article, most of the wetlands in the Midwest have been drained and virtually all the rivers have been degraded by excessive erosion or sedimentation, there is increasing public demand to preserve what is left and restore at least some of what has been lost. Finally, the article concludes that a revised and more effective national flood management program should include aquatic ecosystem restoration.

Keywords: economic modeling, housing markets, Louisiana, mandatory purchase, property values
**Abstract:** This article examines the impact of flood risk and the mandatory purchase of flood insurance on property values. Using a large data set of almost 2,000 homes sold in the New Orleans, LA, area from 1971 through 1986, the analysis confirms the findings of earlier studies that location in a floodplain reduces property values. The present study, using spline variables to adjust for locational variation in the data and an improved measure of insurance cost, reveals that much of this reduction can be attributed to mandatory flood insurance coverage. Moreover, while unexpected flooding does increase the capitalization of insurance costs, repeated flooding does not seem to reduce property values further.

**Keywords:** floodplain, levees, Missouri, Midwest floods of 1993

**Abstract:** This article presents the on-going conflict between conservation groups and development agencies in the Midwest, specifically Missouri. The author focuses on federal legislation and how it can be unclear in dealing with Floodplain regulation on a local level. She points out other cities and states, such as Charlotte, NC and Illinois that have adopted stricter regulations that will, in the long run, save money and hopefully, minimize destruction for future possible flooding disasters for communities.

**Keywords:** floodplain management, Midwest floods of 1993, public policy

**Abstract:** This paper presents a brief overview of the Midwest floods of 1993 as the context for understanding the Army Corps of Engineers’ responses to the policy and programmatic recommendations in the aftermath of the flood. The paper argues that generally, what is lacking for good decision making is basic information, rather than research. Public policies are being made in the absence of good information in the form of data about flood damages, degree of inundation, and severity and frequency of flooding. The author argues that research is needed to improve and refine existing methods rather than to create entirely new approaches or methods. Finally, much of the research and analysis that is required to act on the recommendations of the “Galloway Report” is to improve the administration and effectiveness of existing programs.

**Keywords:** Army Corps of Engineers, modeling, risk assessment

**Abstract:** Controversy continues over the relative merits of traditional frequency estimators and the “expected probability” estimator of flood risk that incorporates an adjustment for parameter uncertainty. Both have solid theoretical motivation, but address different concerns. The description of hydrologic risk and uncertainty provided by new risk and uncertainty procedures adopted by the Army Corps of Engineers, and risk-based design procedures developed by others, are shown to be equivalent to the expected probability model in simple cases. A 1995 National...
Research Council (NRC) report recommended against use of the expected probability model for evaluating expected annual damages and the probability of flooding. In particular, the NRC analysis and the 1989 Amell analysis demonstrated that expected probability estimators yield risk and damage estimators that generally have large positive biases. Historical arguments and related issues are reviewed. Resolution of this controversy and success of the new Army Corps of Engineers’ risk and uncertainty procedures require a clear framework for understanding what is meant by risk, variability, and uncertainty. Such risk analyses can better represent local vulnerability to flooding and the large uncertainty in estimates of expected damages and residual flood risk.

**Keywords:**
legal issues and litigation, mitigation, NFIP, public policy

**Abstract:** The NFIP has been in existence for over 30 years and nearly 20,000 communities participate in the program. Policy has been issued through a variety of sources, including Policy Notices, when the program was part of the U.S. Department of Housing and Urban Development in the 1970s, supplemented by policy memoranda, letters to communities and various FEMA publications. Thus, there is a significant amount of policy guidance available to communities, but not compiled in a single document, or widely accessible to most. The purpose of this document is to provide local officials with a summary of policy, applicable to FEMA Region X, based on Policy Notices, the *NFIP Floodplain Management Guidance Handbook*, policy letters, memoranda, publications, and related documents. The document is not meant to provide all available details on a particular policy, but includes references to original documents if additional information is needed. A sample of the topics covered in the document includes manufactured home elevation, freeboard, crawlspace construction, and community permitting.

**Keywords:**
Base Flood Elevation, coastal areas, coastal barriers, development, Hurricane Andrew, Louisiana, modeling

**Abstract:** Management and restoration of natural systems requires the quantitative assessment of the impact and cost effectiveness of management alternatives. This paper describes the methodology used in Louisiana to evaluate the role of barrier islands in influencing wetland hydrology and some preliminary results. The objective of the evaluation was to determine the effect of barrier island geometry on the duration and depth of inundation of coastal wetlands under average and extreme conditions. The model selected for use was the overland flooding model developed by FEMA to predict hurricane flood elevations for the NFIP. The model uses an explicit, two-dimensional, space-staggered, finite-difference scheme to simulate the flow of water caused by tides and wind systems. The current size of the inlets between the islands is several times the equilibrium area based upon the tidal prisms. Slight reductions in the cross sectional areas of the inlets between the islands had only a very minor effect on reducing the depth and duration of wetland flooding. If the barrier islands were removed from the model, the depth and duration of tidal flooding slightly increased. Under extreme conditions, the island
height and inlet size had a significant effect on the depth and duration of wetland flooding. Hurricane Andrew produced a maximum surge elevation at Cocodrie of about 2.7 m. The predicted surge elevation at Cocodrie would have been about 0.3 m higher if the present barrier islands were destroyed and would have been as much as 1.2 to 1.5 m lower if the barrier islands were raised and the inlets narrowed.

**Keywords:** floodplain management, Maryland, New York, Pennsylvania

**Abstract:** This report provides statistical data on the population characteristics of the Susquehanna River Basin and the changes in NFIP participation and coverage in a five-year period. Between 1978 and 1982, flood insurance policies in the river basin decreased by over 15,000 or 22.6 percent. In contrast, the amount of insurance coverage per policy increased in the five-year period. Detailed statistics on policy coverage are provided by state, county, and subbasin. The Susquehanna River Basin Commission is an independent water resources agency created amongst the states of Maryland, New York, the Commonwealth of Pennsylvania, and the federal government.

**Keywords:** flood causes, insurance industry, NFIP

**Abstract:** The report presents the results of a survey of flood insurance schemes in various countries. The survey revealed that different countries approach the insurance of flood hazards in different ways, with varying involvement of the reinsurance industry, different insurance penetration levels, and a wide range of coverage levels. The survey concludes that given country-specific market structures and flood hazards, the widely different approaches are all feasible. The report goes on to note that there is room for improvement of flood insurance worldwide. Insurance penetration can be improved in many markets, as can the terms and conditions of coverage. The report also recommends an improvement in data collection to more effectively address flood hazards.

**Keywords:** England, health effects, socioeconomic impacts

**Abstract:** This report examines the health effects of the 1998 Easter flood, a small-scale flood in England, to develop a conceptual model to illustrate a flood’s effects on overall well being. To create the model, a list of factors that contribute to the total effects of the flood on health is devised. The report includes a list of all health effects reported by victims. In addition to health
effects, the report points out a loss of confidence in authorities following a flood event and says that this further contributes to stress and ill health. The conclusion reached is that the flood disrupted many people’s lives, caused stress, and often impacted both physical and mental health. The report states these negative impacts are exacerbated by lack of warning before a flood, and so recommends “a new perspective on flooding” that gives more focus to flood warnings. The report also recommends enhancing support systems for victims.

Keywords: federal programs, Unified National Program

Abstract: This report advocates a unified national program for managing flood losses utilizing federal agencies such as the Army Corps of Engineers, the Department of Agriculture, the Department of Housing and Urban Development, the Geological Survey, and the Environmental Science Services Administration. Federal expenditures in flood protection and prevention by the Army Corps of Engineers and the Soil Conservation Service total $7 billion since 1936 and nearly $500 million annually in 1966. The report states that in its current form, federal flood programs cannot adapt to the increased costs of flood disasters. It recommends improvements in knowledge about flood hazards through standardization of the definition of a flood hazard, determination of the frequency of floods, and collection of flood damage data. Data collection would focus on mapping flood hazard areas, their physical boundaries, and at-risk populations and structures. Federal programs that impact land use in floodplains, such as transportation and regulation of lending institutions should be modified to reflect the goal of decreasing flood hazards.

Keywords: agency operations and management, mapping, strategic planning

Abstract: In 1994 Congress passed the National Flood Insurance Reform Act and directed FEMA to establish the Technical Mapping Advisory Council. The Council began its work in 1996 and is charged with providing recommendations to FEMA on ways to improve FIRMs and the mapping process. In this report, the Council set goals in five areas: general, preparation of maps, map determinations, distribution of maps and other information, and communication and public education. These goals reflect the needs and concerns of the customers for NFIP maps and mapping products. The Council also makes several recommendations to FEMA: 1) establish an archival system for maintaining in perpetuity for historic and legal purposes all FIRMs and supporting technical data; 2) distribute all letters of map change with each map ordered; 3) distribute, in digital form, all certification forms required to be submitted with map revision requests; 4) develop a position on any proposed legislation that delegates letters of map change to entities other than FEMA, and 5) implement newer technologies for the production and dissemination of FIRMs.

**Abstract:** In 1994 Congress passed the National Flood Insurance Reform Act and directed FEMA to establish the Technical Mapping Advisory Council (the Council). The Council began its work in 1996 and is charged with providing recommendations to FEMA on ways to improve FIRMs and the mapping process. In this report, the Council recommends that FEMA take the
following steps: (a) encourage and support use of future land-use conditions in calculating floods and delineating floodplain limits; (b) improve floodplain delineations that were derived by approximate study methods and mapped as Unnumbered A Zones; (c) support the use of the recently issued study guidelines for mapping alluvial fans; (d) develop and implement procedures for including data in products about multiple hazards that pose flood risks and continue to participate in the Open GIS Consortium to provide links to other sites containing retrievable data affecting flood risks; and (e) establish an indexing and retrieval system for archived data.

**Keywords:**
agency operations and management, mapping, strategic planning

**Abstract:** This report encapsulates five years of work done by the Technical Mapping Advisory Council (the Council). It responds to a congressional mandate to evaluate and recommend improvements to the production, distribution, and use of FIRMs and other mapping products prepared by FEMA in support of the NFIP. Although the report makes numerous recommendations, the Council deemed the following recommendations as the most important: (a) acquiring additional financial and technical resources for map programs; (b) building constituent interest and public support for modernizing the mapping program using a process that includes public education and public outreach; (c) building partnerships among various federal, state, and local governments, universities, and the private sector to accomplish NFIP objectives; and (d) creating a fully digital environment for floodplain mapping and all related information.

**Abstract:** In 1994 Congress passed the National Flood Insurance Reform Act and directed FEMA to establish the Technical Mapping Advisory Council. The Council began its work in 1996 and is charged with providing recommendations to FEMA on ways to improve FIRMs and the mapping process. In this report, the Council recommends that FEMA fund a study leading to recommendations for effective nomenclature to be used in referring to flood potential and severity; develop and support partnerships with other federal agencies, states, local, and regional governments, citizens, and other organizations in the development, updating, and revision of FIRMs; develop and distribute standards, in collaboration with federal and state agencies, on techniques for mapping coastal erosion rates to ensure the credibility of erosion maps; continue to provide specific technical guidance for contractors studying flood risk in communities where ice jam flooding is a concern; and reinvent the Flood Insurance Study (FIS) in various ways. Finally, the Council noted that fiscal budget limitations continue to constrain implementation of its recommendations and requests that they not be subjected to dormancy.

**Keywords:**
floodplain management, methodology, Tennessee Valley Authority

**Abstract:** The document is a resource developed by the Tennessee Valley Authority to aid assessment of communities that have limited floodplain management experience. It describes the process used to obtain, record, interpret, summarize, and use information gathered during an evaluation. The document emphasizes a comprehensive and well-documented set of procedures. The procedures contained in the guide have been field-tested in 16 communities in the Tennessee Valley watershed, ranging in population from 4,800 to 170,000. Researchers conducted community evaluations in two-person teams, consisting of a community specialist and a civil engineer. Later evaluation attempted different combinations of evaluator teams to test the transferability of evaluation procedures. The evaluation found that procedures were readily transferable to staffs of regional, state, and federal floodplain management agencies. One evaluator with limited assistance from a community staff person could adequately perform the evaluation. The report concludes that the average time needed to perform a community evaluation was 40 hours for the evaluator, four hours for the local staff person, six hours for clerical support, and two hours for the program manager.

**Keywords:**
mitigation

**Abstract:** Literature from diverse sources such as public expenditure economics, management science, geography, agriculture, and engineering reveals a wide range of decision frameworks for deriving strategies for flood mitigation. This paper reviews these different types of decision frameworks aiming to provide an understanding of these frameworks, along with their relative adequacies and inadequacies. Such an understanding reveals the directions along which the formulation of a more adequate framework should proceed. However, the formulation of a given decision framework is influenced by the types of economic benefits associated with the flood mitigation measures considered in that framework. Hence, the paper reviews the various flood mitigation measures prior to discussing the various decision frameworks.

**Keywords:**
dams, modeling, risk assessment

**Abstract:** Safety studies for existing dams have found that some do not satisfy current estimates of the probable maximum flood. An event or influence diagram can describe the random factors that contribute to major inflow floods and that determine reservoir operation and possible downstream damages during a flood event. This allows calculation of the probability of dam failure and the distributions of damages and loss of life using combinations of various analytical and Monte Carlo methods. This paper discusses the efficiency of different evaluation methods: event trees, simple Monte Carlo sampling, Latin hypercube sampling, importance sampling, and
an analytical/stratified Monte Carlo (A/SMC) method. The analysis suggests that the A/SMC method and importance sampling have great potential for the efficient estimation of dam failure risks. Numerical examples employ the distributions of damages and loss of life to show the character of trade-offs presented by different decisions and illustrate problems with the partitioned multi-objective risk method. The use of partial expected damage and loss of life functions is recommended to show the importance of low-probability/high-consequence events.

**Keywords:** economic modeling, flood control, Oregon, property values

**Abstract:** An implicit price model relating residential lot value to price-determining characteristics is developed to measure the benefits of a structural flood control project in Sutherlin, OR. Special attention is given to the selection of relevant price determining characteristics of residential lots. Implicit price equations are used to estimate damages with and without flood protection. A dummy variable indicating location in the floodplain quantifies flood damages for the equations. The regression results indicate that residential lots exposed to flood hazards are valued less than lots not exposed to the threat of flooding. Furthermore, the analysis shows that annual flood damages were reduced by $15,275 as a result of the structural flood control project.

**Keywords:** attitudes, flood control, Virginia

**Abstract:** Estimated benefits of flood control projects are typically limited to avoided property damages. However, the possibility that there are benefits from reduced psychological stress among floodplain occupants and benefits to the community has long been recognized. A survey of landowners residing in a floodplain in Roanoke, VA, found that nonproperty considerations helped explain their expressed willingness to pay for flood control. Of particular importance was the respondents’ concern for disruption of the community caused by possible flooding.

**Keywords:** cost-benefit analysis, economic impacts, property values, structural approaches, Washington

**Abstract:** This study evaluates the effect of elevating a home on its selling price and time on market, compared to nonelevated homes in Snoqualmie, WA. The study concludes that the market price penalized nonelevated homes within the floodplain and that the market price of elevated homes exceeded that of nonelevated homes by 25 to 70 percent of the cost of the retrofit. The difference is a substantial return when compared to the initial investment in retrofitting of 12 to 25 percent and greater than the reduced cost of flood insurance for an elevated home. While there is some financial gain to the property owner of elevated his home, this gain does not equal the cost of elevating the home. Absent intervention by the state,
individual property owners would not elevate flood-prone homes. The implication is that the gains for the community from the reduced need for disaster response and recovery assistance outweigh the individual benefits to the homeowner.

**Keywords:** risk assessment

**Abstract:** This book provides a descriptive guide to assessing the risk of the flood peril, particularly focusing on river floods. It is designed to help insurers evaluate and differentiate the risks to be covered. The necessary capability in risk assessment requires an understanding of the phenomena and the essential parameters that lead to flooding and that influence damage and losses. This book includes discussion on recent significant flood events, methodology of risk assessment, hazards, vulnerability, flood protection, insurance and reinsurance aspects, other causes of flooding, rainfall data for selected places, a list of major historical floods, and a list of flood related web sites.

**Keywords:** floodplain management, levees, Midwest floods of 1993

**Abstract:** A history of flood control in the United States shows an undying affair with levees. This love affair, however, was put to the test by the record flooding in the summer of 1993. About 70 percent of levees in the upper Midwest failed during this time, leading to extensive damage to both farmland and urban areas. Consequently, there were repeated calls to reassess policies for floodplain management. The report of the Interagency Floodplain Management Review Committee is one outcome of this and it forms the basis of this commentary on levees. In many respects, levees are effective flood control measures, being relatively cheap to implement and easy to build. At the same time, levees have negative impacts, affecting the hydrological regime both up and down stream, and often exacerbating flooding in other places. Furthermore, technical weaknesses in design, planning, construction, and maintenance have all contributed to the failure of some levees. While the report recommends changes in floodplain management to address some of these issues, it is difficult to see how these will materialize given the current political, economic, and social climate.

**Keywords:** California, property values

**Abstract:** This study examines the impact of flooding on residential property values. It reviews the literature and produces a theoretical conceptualization which is then applied to the analysis of the 1986 flood in Linda and Oliverhurst, in Yuba County, CA. The authors found support for the premise that flood frequency affects the capitalization process. In other words, the flood is initially capitalized into housing values but, because of the infrequent nature of the hazard, values are expected to rise, although the time for recovery is not certain.

**Keywords:**
housing markets, Illinois, property values

**Abstract:** This article investigates two questions: How does the residential real estate market respond to a high probability of flooding? Is there an identifiable pattern that might result in a predictive model of changing floodplain and land values? The authors contend that the more floods experienced the greater is the impact on the housing market and use Des Plaines, IL, as a case study. Using flood histories, impacts of recent flooding, and longer-term trends in the housing market, the researchers found that flood frequency is a valid spatial variable, demonstrated by variation in the recovery periods of housing prices consistent with variation in the flood frequency in those markets. Thus, the researchers conclude that flood frequency is an important variable to consider in evaluating property values.

**Keywords:**
California, economic modeling, Illinois, Pennsylvania, property values, urban areas

**Abstract:** Literature on the flood hazard/residential land market relationship is full of contradictory findings, many of which are counterintuitive to the belief that flooding has a negative impact on house prices. This research advances a conceptual framework through which these relationships might be reexamined. Based on the expected utility model, the theoretical framework integrates the economic notion of capitalization with spatial and temporal characteristics of the flood hazard. Four communities with different flood regimes are used to test the effect of flooding on the residential real estate market. Results show that: (a) there is an identifiable relationship between characteristics of the flood hazard and changes in house values; (b) the length of the recovery period is dependent on characteristics and expectations of flooding, attributes of the real estate market, and the availability of capital to fuel recovery; and (c) dynamics of the urban market and spatial extent of the flood hazard influence these relationships. Further research is now necessary to examine these findings under different spatial, temporal, hydrologic, and socioeconomic conditions.

Available at: [http://www.colorado.edu/hazards/qr/qr95.html](http://www.colorado.edu/hazards/qr/qr95.html)

**Keywords:**
California, property values

**Abstract:** The authors assess the relationship between flooding and property values in Linda and Olivehurst, CA, an area that suffered several floods (with impacts first studied in 1986). Following a theoretical framework developed by Tobin and Newton (1986), the authors find that properties that experienced the first flood did eventually recover to near preflood levels, but the length of time required for recovery varied with depth of flooding (houses with lower flood...
levels recovered more quickly). Thus, the flood created submarkets that remained identifiable over the long term in part because not all properties in the areas with the greatest flood depths were repaired (the remainders that exist in the communities influence recovery and this perpetuates the submarkets). The 1997 flood further compounded the situation.

Keywords: property values, urban areas

Abstract: By integrating literature from flood hazard research and urban economics, the authors developed a theoretical structure to explain changes in residential land values following flood events. The negative aspects of the flood hazard are shown to be capitalized in the value of the property. Land values will vary both spatially across the floodplain and temporally depending on the frequency, severity, and spatial characteristics of the flood event. This approach allows for the recovery of the land market value, a novelty at that time. This theoretical approach was later applied in several studies (e.g., Tobin and Montz, 1988).

Keywords: closed-basin lake flooding, North Dakota

Abstract: The report provides a case history of a pervasive flood hazard not routinely addressed by federal flood mitigation programs – closed-basin lake flooding, caused by runoff from local flooding, at Stump Lake in Nelson County, North Dakota. The research addressed the extent and distribution of costs arising from closed-basin flooding, the adequacy of existing mitigation programs, and unmet needs for mitigation assistance. The research found that flood damages from the rising levels of Stump Lake were primarily related to transportation infrastructure and that rural wetland flooding was more pervasive than closed-basin flooding in the research area. Direct payment for flood damages and infrastructure costs, borne primarily by the federal government, were a significant percentage of total damage costs. Indirect costs, such as reduced production capability arising from the large amount of land taken out of production were nearly as large as direct federal payments, and were borne entirely by the county and region. A reduced county tax base and income, declining rural population, and increase local cost share on infrastructure projects placed a sizable strain on the county and regional economy. The report concluded that because FEMA flood policy is written with riverine or coastal flooding in mind, there are significant unmet mitigation needs for closed-basin floods.

Keywords: communication, disaster planning, public policy
Abstract: Previous research into disaster communications, while fairly extensive, has been limited primarily to sociological analysis and organizational theory. This body of research, however, has not explored disaster communications in a federal, international, or other multilevel governmental response system. This paper expands upon existing research to present a new theory of intergovernmental disaster communications based on the concept of intergovernmental distance. Intergovernmental distance refers to distance in terms of differing procedures and approaches used by organizations in different functional areas at various levels of government. The theory postulates that the organizational distance created by these differences becomes a critical factor that must be addressed during a disaster. The study employs three sets of dimensions. The first uses two subdimensions and examines distances between functional areas at various levels of government. The second uses three dimensions and considers distances between functional area and central management. The third is multidimensional. It uses a multiple regression equation to analyze intergovernmental distance. The study concludes by addressing the policy implications of the findings, especially the need to overcome inherent intergovernmental distance through disaster planning, the need to recognize the exponential increase in communications problems caused by increases in the number of disaster responders, and the need to determine whether the marginal benefits contributed by each new responder exceed the marginal communications and coordination costs each responder imposes.

Keywords: agriculture, flood control, floodplain management, levees, Midwest floods of 1993, Mississippi River, wetlands

Abstract: This article focuses on the proposal to reform policies affecting the Mississippi River’s floodplains in the wake of the damage caused by the Midwest floods of 1993. It discusses the impact of the flood on agricultural and urban property owners, the construction of mainstream levees, and the conversion of floodplain wetlands to agriculture. The article concludes that the conversion of floodplain wetlands to agriculture throughout the Mississippi River Basin has been extensive. Eighty percent of the floodplain wetlands of the Lower Mississippi River have been cleared and converted to cropland. Clearing rates in much of the Upper Basin and the Missouri River system have been comparable. Furthermore, the Mississippi River’s flood control system of dams, levees, and river training works is tremendous, but not sustainable over the long term: “People have gone too far in severing the river and its tributaries from their floodplains. The message from the floods is that the Mississippi River wants to recapture the floodplains that were historically part of the river. It lies in wait for major flood events to do this.” The article concludes: “A program of floodplain restoration would go a long way towards creating a much more sustainable, low-cost flood management system in the Mississippi River Basin than exists today.” The article also focuses on the economics behind such a floodplain policy. It suggests that the Army Corps of Engineers must reform how it spends federal dollars on flood control works in the basin, while the federal government expands the Wetland Reserve Program created by the 1990 Farm Act in the Mississippi Basin.

**Keywords:**
California, insurance purchase decision, lending institutions, property values

**Abstract:** This study analyzes the effect of flood hazard disclosure under the 1998 California Natural Hazard Disclosure Law (AB 1195) on property values throughout California. It found that the average floodplain home sold for 4.3 percent less than a comparable non-floodplain home after the passage of the law. Prior to the law, there was no significant price differential between floodplain and non-floodplain homes. The law particularly affected housing prices in Hispanic neighborhoods. Differences in mortgage origination mechanisms between whites and Hispanics appear to account for the effect of racial composition on housing prices. Hispanic homebuyers obtain financing disproportionately from unregulated sources that are not required by FEMA to make flood determinations, or from “subprime” lenders who specialize in high-interest loans to homebuyers with impaired credit histories. Also, Hispanics are more likely to live in floodplains than any other racial group. The results suggest that homebuyers in Hispanic neighborhoods are better informed under the California Natural Hazard Disclosure Law than they were under the NFIP. In terms of national significance, the negative price effect of flood disclosure following the law suggests that NFIP flood disclosure requirements are inadequate.

**Keywords:**
compliance, enforcement, floodplain management, mapping, mitigation, risk assessment

**Abstract:** A review of the NFIP concludes that sufficient progress is being made and that, in the opinion of the author, both regulation and insurance should continue. The regulatory program in developed floodplains has had a limited effect on flooding, erosion control, and water supply; results have been more successful in developing floodplains. Persistent problems with respect to the protection of floodplains include: (a) the lack of awareness of flood problems by residents, (b) the lack of adequate data on numbers of people living in floodplains; (c) the effectiveness of floodplain regulations; (d) the difficulty in administering an effective local program in the face of local politics; and (e) the definition of floodplains using existing hydrology when urbanization will influence future flows. Though generally successful, the NFIP has some mixed results. Ways have not been found to manage risk in the fringe areas or areas without special flood hazards. Some 30 to 50 percent of flood damage may occur in these areas. Additional issues requiring attention include mapping flood hazards, economic modeling in the analysis of alternatives, differences between communities and among building types, questions about different levels of reducing flood risk, and alternative approaches to mitigation.

**Keywords:**
cost-benefit analysis, NFIP

**Abstract:** The report questions the costs and benefits of the current NFIP model, in which the government rather than the private insurance market supports the bulk of the implementation of flood insurance in floodprone areas. The author uses the program’s operating budget losses of fiscal years 1996 and 1997 as evidence of the fiscal unsoundness, or at least, vulnerability of the NFIP. FEMA has attempted to correct this situation with such programs as the Community Rating System (CRS), which provides an incentive for floodplain management beyond the
NFIP’s minimum requirements and recent actions to target repetitive-loss structures, which cost the NFIP up to $200 million per year. However, after more than three decades of the NFIP, and more than 10 of the CRS, the NFIP seems not to have attained long-term cost efficiency. The author calls for a clear examination of costs and benefits, based on a reexamination of the priorities of the program. If the premise of the NFIP is that the government has an obligation to use taxpayer dollars to provide aid to disaster-stricken areas, current standards are likely to satisfy a cost-benefit analysis. In contrast, if actuarial soundness is the goal of the program, significant improvements must be made.

Keywords: health effects, Midwest floods of 1993
Abstract: This study uses longitudinal data to examine the potential moderating effects of social support and age among older adults exposed to an acute stressor. Using a sample of 651 older persons, data were gathered in the spring of 1992 and in the fall of 1993, approximately 60 days after the peak impact of flooding in the Midwest. Results indicate a positive association between pre- and post-flood depression and a negative association between social support and post-flood depression. For the younger of the two older age groups, there is also a positive association between flood exposure and post-flood depression, controlling for prior levels of depression. Age interactions reveal that social support moderates the effects of flood exposure on depression only for the younger age group.

Keywords: coastal areas, Coastal Barrier Resources System, development, mitigation, repetitive losses
Abstract: Federal disaster programs inadvertently encourage people to build in high-risk coastal areas, and taxpayers pay most of the cost ($5 billion a year). FEMA has tried to block federal spending, but Congress has been reluctant to make reforms. Congress also rejected FEMA’s request for more funds for a project that requires property owners to elevate properties to make them less flood-prone. One proposal would allow no more than two claims (repetitive claims account for 36 percent of all payments), and others would bar insurance for vacation homes and rental properties. Environmentalists want to ban people from building close to the shore, but the U.S. Supreme Court ruled that states must compensate owners by paying the market value of their land if they ban development on private property. The Coastal Barrier Resources Act of 1982 was designed to discourage development on sections of barrier islands, but it spurred development in other coastal locations, creating expensive communities.

Keywords:
coastal areas, development, Massachusetts, South Carolina

Abstract: USA Today examined development in 1,000 counties along the Gulf and East Coasts and found these counties growing significantly faster than the rest of the country in population, employment, and gross domestic product. One in seven Americans lives along the East or Gulf Coasts, and beach economies are growing fast as jobs, businesses, and services follow this migration. Urban planners say that growth along these coasts will continue for 10 to 20 years and will be fed by demographic, economic, and social trends, such as the aging of the baby boomers with financial resources to fulfill their retirement dreams, telecommuting opportunities, improved transportation, and the quest for a better lifestyle. The article discusses the changing character of Cape Cod, MA, and Beaufort County, SC, with some attendant problems such as lack of affordable housing, water pollution, and strains on local government.

Keywords: coastal areas, hurricanes, mapping, zoning

Abstract: The experience and analytical methods of USACE provided the impetus for these guidelines. The guidelines outline a suggested procedure for identifying areas along the Atlantic and Gulf Coasts subject to inundation by a hurricane surge and to significant wave action. Both of these conditions warrant specific building restrictions and special flood insurance rates. Most important, the guidelines identify the “3-foot breaking wave” as having the capability for damaging buildings. FEMA subsequently used this type of wave to distinguish V Zones from A Zones for the NFIP.

Keywords: compliance, development, floodplain management, Mississippi, modeling, property values

Abstract: This study assesses and analyzes the floodplain management activities that have occurred in Hattiesburg, MS. FEMA requested the study to determine the long-term impacts of a floodplain management program in a community. Using a computer model to quantify flood damages for 13 simulated conditions, the Army Corps of Engineers studied the city’s three primary sources of flooding—the Leaf and Bowie Rivers and Gordons Creek—for the period from 1968 to 1989. Based on the analysis, the Corps of Engineers concluded that the floodplain in the city has grown over time in terms of both the number of structures and property values. For example, during the first 14 years of Hattiesburg’s participation in the NFIP average annual damages increased by $299,500 due to development in the floodplain. However, in the absence of the city’s participation in the NFIP and the completion of projects by the Army Corps of Engineers, flood damages would have increased by $1,519,800. The net effect of NFIP regulations when compared to no regulations (i.e., an unregulated floodplain), represents on average an annual savings of $605,000.

Keywords:
Army Corps of Engineers, mitigation, structural approaches

Abstract: This report provides statistical information on storm events and flood damages nationwide, as well as flood damages prevented by projects controlled by the U.S. Army Corps of Engineers. In fiscal year 1992, the Army Corps of Engineers’ flood control projects and emergency activities prevented an estimated $8.1 billion in flood damages, or 91 percent of the potential flood damage to the nation. Total damages prevented between fiscal years 1982 and 1991 averaged $13.3 billion annually. The majority of flood damages suffered and flood damages prevented were concentrated in just a few states. The report contains detailed narrative accounts of storm events and other disasters nationwide in fiscal year 1992.

Keywords: Army Corps of Engineers, property values, wetlands

Abstract: This technical note provides a framework for evaluating the economic value of wetlands. More precisely, the note provides a guide for determining the effects of a proposed action on a wetland site. It emphasizes the importance of estimating the value of establishing the relationship and significance of the economic services of a wetlands site within a larger economic context. The note points out that the evaluation of flood control benefits requires estimating flood damages with and without the wetland’s flood control capacity. These benefits can be determined by establishing the relationships between wetland flood storage capacity and flood damages downstream and the cost of providing alternative flood control structures or provisions for flood control.

Keywords: Army Corps of Engineers, building codes, floodproofing

Abstract: This publication supercedes the two previously published editions (1972, 1992) that have been distributed worldwide as an administrative and technical model for code design and enforcement of floodproofing. This version of the report includes updates made in 1992, which reflect almost 20 years of field experience, research, and advances in engineering and building practices. The 1992 revision made numerous technical and editorial changes to requirements for floodplain management. The publication makes some clarifying changes to the 1992 edition, but retains the format of the 1972 edition. It specifies the floodproofing measures and techniques that can be followed to regulate private and public building construction in flood hazard areas. The publication also contains implications for changes in existing building and house codes and provides for a diversity of floodproofing methods and techniques.

Keywords: floodplain management, Midwest floods of 1993, Mississippi River, Missouri River
Abstract: This report compares impacts and costs of implementing a wide array of alternative policies, programs, and structural measures by assuming they had been in place at the time of the Midwest Floods of 1993. The analysis explores three scenarios of changes in flood insurance, state and local floodplain regulation, flood hazard mitigation and disaster assistance, wetland restoration, and agricultural support policies. Data collected for the report, such as the economic damages from the 1993 flood, came from various sources. Feedback received during the coordination of this assessment presents contrasting views regarding the use of floodplains. However, the report does not resolve all of the issues or recommend an overall best plan. Rather, it serves as another tool in understanding the relative impacts of various potential actions.

Keywords: Army Corps of Engineers, cost-benefit analysis, mitigation, risk communication

Abstract: Procedures described in this manual lead to the estimation of expected costs and benefits of proposed flood damage reduction measures, a description of the uncertainty in those estimates, and quantitative and qualitative representations of the likelihood and consequences of exceeding capacity of selected measures. The Army Corps of Engineers suggests that the careful communication of analysis results will better inform the public about what to expect from projects to reduce flood damage and thus ultimately lead to better decision making.

Keywords: Army Corps of Engineers, floodproofing, mitigation, nonstructural approaches

Abstract: The Flood Plain Management Services (FPMS) Program of the Army Corps of Engineers prepared this report. The FPMS Program uses its technical expertise in floodplain management to help parties outside the Corps of Engineers, both federal and nonfederal, deal with matters related to floods and floodplains. Most of the examples in the report come from a national survey developed and administered by USACE to document the various floodproofing techniques used around the nation. The Army Corps of Engineers collected additional information for the survey from local, state, and federal agencies involved in water resources planning. Results of the survey revealed innovative floodproofing efforts by people in their effort to reduce flood damages. The survey found many commonplace efforts, such as elevating structures and building levees and floodwalls. In addition, the survey noted several ingenious and complicated techniques, such as floatable houses and floodproofing stations controlled by computers. Most examples feature residential structures, but the report documents commercial structures as well. Of the structures tested by actual flooding conditions, USACE classifies approximately 50 percent as effectively floodproofed. Furthermore, the report provides conceptual ideas for formulating individual floodproofing plans.

**Keywords:** Army Corps of Engineers, floodproofing, mitigation, nonstructural approaches

**Abstract:** This report presents results from a series tests on floodproofing conducted by the Army Corps of Engineers. USACE analyzed closures, materials, and systems to determine their effectiveness in protecting both residential and commercial properties from floodwaters. The experimental tests in the report deal with the treatment of brick-veneer and concrete-block walls—two commonly used building materials. Based on testing, the Army Corps of Engineers reached a number of conclusions including, but not limited to, the ability of two layers of brick to allow a brick-veneer wall to support greater water depths and the unreliability of epoxy, polyurethane, and asphalt coatings to keep water from penetrating a brick-veneer wall.

**Keywords:** floodproofing, mitigation, nonstructural approaches

**Abstract:** Many approaches to flood protection and flood loss reduction including the elevation or relocation of existing structures have not gained recognition as economically viable practices for structures on concrete slab foundations. In the case of slab foundations, two practical possibilities exist: detaching the structure from the floor slab or moving the entire structure with the slab attached. The latter method is not widely known and understood and is often believed to be infeasible. In practice, moving an entire structure with slab attached has proven both technically and economically feasible and has presented many advantages in the hands of an experienced structural mover. This report discusses the procedures for raising or relocating "slab-on-grade" structures with the slab attached, to identify some of the advantages and disadvantages, to suggest some factors to consider, and to indicate the possible costs involved. The procedures and techniques described here come primarily from those employed by a professional structural mover in Tampa, FL. Other professionals in the field can employ different but equally effective methods. No undertaking of this magnitude should be attempted without the advice and assistance of professional structural movers and structural engineers or architects.

**Keywords:** Army Corps of Engineers, floodproofing, mitigation, nonstructural approaches, Tennessee

**Abstract:** This report documents a successful floodproofing project in Goodlettsville, TN, where USACE elevated 19 homes. The report provides background on the project and gives a detailed description of the homes involved, the implementation procedure used, and the project costs incurred. The Nashville District of the Army Corps of Engineers used a nonstandard approach
that reduced administrative costs by minimizing the involvement of the Corps and maximizing the involvement of homeowners. Homeowners had the opportunity to control many aspects of the work to ensure their satisfaction with the project. Appendix A discusses the economics of the floodproofing project. Appendix B presents samples of documents (information packages, agreements, covenants, etc.) used in the program. Finally, Appendix C summarizes the cost data and offers an equation that can be used to estimate costs during the early planning stages on similar projects.

**Keywords:**
- floodproofing, mitigation, nonstructural approaches

**Abstract:** This document provides discussion to assist property owners, engineers, and contractors make a preliminary evaluation on the appropriateness of floodproofing and determine what floodproofing technique has the greatest effectiveness for the given conditions. Chapter 1 describes how floodproofing can reduce flood damage to buildings and their contents. Chapter 2 addresses factors to consider when contemplating floodproofing, such as local building codes, high costs associated with some types of floodproofing, and the inability to floodproof certain types of buildings. Chapter 3 provides brief descriptions of various floodproofing measures and refers the reader to sources providing more detail on techniques suitable for the structure under evaluation. Chapter 4 assesses the characteristics of flood situations. Chapter 5 summarizes the thought process behind evaluating physical, economic, and other factors involved in determining the viability of floodproofing for a structure that has experienced flood damage or has a significant potential for being flooded. Appendix A presents a detailed explanation of how to evaluate floodproofing options. Appendix B contains worksheet forms and graphs and Appendix C addresses hypothetical cases and illustrates factors that influence decisions about whether to floodproof.

**Keywords:**
- Army Corps of Engineers, floodproofing, Kentucky, mitigation, nonstructural approaches, structural approaches, West Virginia

**Abstract:** For three days in April 1977, torrential rains and a subsequent flood caused monumental damage in the Tug Fork Valley of southern West Virginia and northeastern Kentucky. During a 50-year period, the Valley had experienced 37 damaging flood events. However, the April 1977 flood exceeded the 500-year event in many of the heavily populated areas of the Tug Fork Valley. In a few hours, the floodwaters destroyed 600 homes and heavily damaged another 5,000 structures. As the Valley’s residents struggled to regain their foothold on life, the Huntington District of the Army Corps of Engineers began sowing the seeds of a plan to reduce flood damages. Aided by the passage of unique legislation, USACE waded into the flood-soaked Tug Fork Valley and developed a multifaceted plan destined to change the Valley’s development pattern forever. This report presents the features of the plan and concentrates on the application of floodproofing technology in the Tug Fork Valley to reduce future flood damages.
The report also discusses the lessons learned by the Army Corps of Engineers during its mission to achieve a cost effective and socially acceptable solution to flooding problems in the Valley.

**Keywords:** floodproofing, mitigation, nonstructural approaches

**Abstract:** Floodproofing involves altering an existing building or its immediate area to prevent or minimize damage during a flood. Alterations can range from minor changes to the utilities, to waterproofing walls, to elevating the building above flood levels. Floodproofing has significant potential to reduce flood losses. Many people have floodproofed their homes or businesses, often by using common sense or self-taught approaches. During the last decade, federal, state, and local agencies have researched techniques, promoted floodproofing as a viable flood protection measure, and assisted property owners in implementing projects. This report provides advice for local communities interested in financing floodproofing projects. It does not represent a formula for developing a model program, because each community must design its own approach based on local flood hazards, building conditions, financial needs and resources. The report provides examples and photographs of projects financed by local governments. Appendix A summarizes local programs that have funded multiple floodproofing projects and mentions contact information for communities that have investigated and/or designed financing programs for floodproofing.

**Keywords:** federal programs, floodproofing, mitigation, nonstructural approaches

**Abstract:** This report addresses various approaches to floodproofing and the programs, references, and terminology of federal efforts in floodproofing. It presents a general overview of floodproofing techniques and provides the reader with information on government agencies that offer assistance and on publications that detail relevant information. The first chapter introduces the reader to floodproofing by explaining its basic concept, general approaches, and specific techniques. Chapter 2 describes floodproofing activities undertaken by the federal government, and Chapter 3 discusses specific floodproofing programs of government agencies. Chapter 4 presents reference publications on floodproofing, and Chapter 5 explains how to locate additional publications on floodproofing from the Floodplain Management Resource Center at the Natural Hazards Center in Boulder, CO. The final chapter provides a glossary of terms related to floodproofing, flood insurance, and floodplain management.

**Keywords:** Army Corps of Engineers, building codes, floodproofing, mitigation, nonstructural approaches
Abstract: This report examines how structural floodproofing measures have performed when tested by actual floods. Researchers collected data from 12 flood events throughout the United States between 1986 and 1997 and then reviewed the damage and building performance data on each structure. The report identifies specific floodproofing measures and whether they failed or succeeded. In most cases the lessons from failed measures have more educational value than the lessons from successful ones. Chapter 4 of the report summarizes several lessons learned in floodproofing structures such as minimizing the amount of obstruction beneath an elevated structure in hurricane and high-velocity riverine areas and purchasing flood insurance for floodproofed structures and contents.

Keywords: Army Corps of Engineers, floodproofing, mitigation, nonstructural approaches

Abstract: Nonstructural techniques for the reduction of flood damages consist of measures such as relocation, acquisition, floodproofing, flood insurance, flood preparedness/warning/response, and public education. Nonstructural techniques have proven to be extremely viable in alternatives consisting of total nonstructural or a combination of structural and nonstructural. The National Floodproofing Committee (NFPC) of the Army Corps of Engineers has recognized that sharing the successes of nonstructural techniques within the Army Corps of Engineers may help those districts considering these alternatives. The NFPC has compiled into this document applicable portions of reports developed by various districts that show the formulation, justification, and implementation of nonstructural projects. The formulation and justification of some projects comply with criteria established by USACE. Other projects documented do not but respond to a specific request from Congress. Examples of both kinds show the wide range of procedures and authorities used by districts to ensure the success of nonstructural projects.

Keywords: cost-benefit analysis, disaster assistance, federal programs

Abstract: This report summarizes current federal disaster relief policies, existing and proposed insurance and loss control programs, and briefly discusses their evolution. A major theme in the report is whether the federal programs for dealing with natural disasters are operating in cost-effective manners. Disaster relief policies present relatively straightforward issues for debate, including eligibility for assistance and the parameters of that assistance. Proposed insurance options, by comparison, require the consideration of additional issues, for example, the achievement of actuarial soundness. Actuarial soundness is one measure of the insurance program’s cost-effectiveness. Insurance programs must also consider the issue of participation and whether the availability of disaster relief may serve as a disincentive to some to participate in insurance programs.

**Keywords:**
coastal areas, erosion

**Abstract:** Participants of the National Conference on Coastal Erosion came from federal agencies, state government, local communities, and private institutions to provide insight into the problems of studying, mapping, regulating, and insuring areas with erosion hazards. The main body of this document consists of the transcript of the conference’s final day. Comments submitted to FIA following the conference varied greatly in length and specificity yet identified three common themes: 1) NFIP legislation should be changed to eliminate the need to distinguish between anticipated and unanticipated erosion; 2) regulations concerning land use should be emphasized in any program addressing erosion hazards; and 3) methods of analyzing recession rates should be evaluated further and any overall standards should accommodate state or regional differences. Correspondence from participants, a list of participants, and a bibliography of documents submitted in conjunction with the conference also appear in the document.

**Keywords:**
development, floodplain management, 1 percent annual chance flood standard

**Abstract:** This study quantifies the economic, social, and environmental effects of regulating the 1 percent annual chance floodplain. Twenty-three communities were selected for analysis according to location, flood hazard type, community size, and economic condition. Effects of floodplain regulations were evaluated by projecting development for 1980 and 1990 under three regulatory scenarios: (I) no regulations, allowing the free market to determine the 1 percent annual chance floodplain use; (II) moderate regulations similar to the current (1981) FIA regulations; and (III) stringent regulations forbidding new development and substantial improvements to existing structures and “correcting” past land-use decisions that interfere with natural functions of the 1 percent annual chance floodplain. The study places findings under the three major categories of effects: economic (flood losses), social (housing units and population), and environmental (land use). Under scenario I, average annual flood losses would increase sharply (29 percent by 1980; 71 percent by 1990). In scenario II, the losses projected in scenario I would be decreased by 87 percent in 1980, and by 85 percent in 1990. Scenario III would produce a small, but measurable absolute decline in average annual flood losses (1 percent by 1990). Under scenario I, the total number of housing units in the 1 percent annual chance floodplain would increase 13 percent by 1980 and 35 percent by 1990. In scenario II, the increase in housing units projected in scenario I would be decreased by 37 percent in 1980 and by 78 percent in 1990. Scenario III would decrease the number of housing units in the 1 percent annual chance floodplain 1 percent by 1980 and 6 percent by 1990. Under scenario I, population in the 1 percent annual chance floodplain would increase 12 percent by 1980 and 29 percent by 1990. In scenario II, the increase in population projected in scenario I would be decreased by 43 percent in 1980 and by 41 percent in 1990. Scenario III would produce decreases population similar to those of scenario II. Finally under scenario I, there would be a continuing, unlimited conversion of open floodplain to urban uses, an additional 37 percent rise by 1990. In scenario II,
the increase projected in scenario I would be decreased 36 percent by 1990. Scenario III would not allow any further development of the floodplain, would begin to remove existing development, and would result in a 2-percent reduction of developed acres.

Keywords: agriculture, Alaska, California, Coastal Barrier Resources System, Delaware, development, economic impacts, federal programs, floodplain management, Florida, Louisiana, Maryland, Michigan, Nebraska, New Jersey, North Carolina, Puerto Rico, Texas, urban areas, Virginia, wetlands

Abstract: Wetlands are a vital element in the biosphere and produce numerous benefits for society. They provide critical nursery habitat for many species of fish and wildlife. By temporarily storing large quantities of water, wetlands play an important role in reducing flooding problems and recharging ground water. This is the second of two reports to Congress on how federal programs impact wetlands. Volume I, submitted to Congress in 1988, examined how federal programs have affected wetlands in the bottomland hardwoods of the Lower Mississippi Alluvial Plain and the prairie potholes of the Upper Midwest. Volume II focuses on 17 additional study areas, selected because they reflect the broad array of problems facing wetlands nationwide: Florida’s Everglades, coastal Louisiana, Texas’s Galveston Bay, the Puerto Rican mangroves and coastal wetlands, California’s Central Valley, western riparian wetlands, southeastern and western Alaska, the Delmarva Peninsula (comprising parts of Delaware, Maryland, and Virginia), North Carolina’s pocosins and other freshwater wetlands, northeastern New Jersey, Michigan’s coastal and northern forested wetlands, and Nebraska’s Rainwater Basin. Volume II contains five parts. The four chapters in Part I describe the federal programs affecting wetlands: agriculture; water development and management; infrastructure, local development, and housing; and resource use, extraction, and development. Parts II through V are organized regionally and examine the 17 study areas.

Keywords: environmental impacts, environmental policy, wetlands

Abstract: The *National Wetland Inventory* is a portal of information on the characteristics and status of the nation’s wetlands. Graphical maps present maps of wetlands, digital data, and wetlands codes, and regulations. The Wetlands Mapper allows users to view and print maps or download custom wetland maps data. With regard to wetlands flora, the Wetlands Inventory develops, maintains, and distributes data and information on plants found in wetlands. Though wetlands comprise 5 percent of the land area of the continental United States, they contain over 30 percent of the nation’s vascular flora. The site also includes links to other plant-related websites. As directed by the Emergency Wetlands Resources Act of 1986, the U.S. Fish and
Wildlife Service monitors and reports changes in wetlands acreage through maps of their characteristics, extent, and status. *The National Wetlands Status and Trends Report*, a summary and analysis of wetlands data, was last published in 2000 and is available online. The report provides the most recent and comprehensive estimates of the current status and trends of the 105.5 million acres of wetlands on public and private lands. Wetlands loss was estimated at 58,500 acres annually, an 80 percent reduction from the previous decade. The primary causes of wetlands loss are urban and rural development and agriculture.

**Keywords:** Coastal Barrier Resources Act, coastal barriers, development, disaster assistance, economic impacts, environmental policy, federal programs, public policy

**Abstract:** According to the U.S. Fish and Wildlife Service, the Coastal Barrier Resources Act has saved taxpayers approximately $1.3 billion since its passage in 1982. This report investigates four areas of federal savings: roads, wastewater systems, potable water supply, and disaster assistance from the Stafford Act. For example in disaster assistance alone, which includes both disaster relief and development assistance from the Stafford Act, the report estimates a combined savings of about $1.279 billion from 1983 through 2010. While evidence indicates the Act has saved taxpayers’ money, uncertainty still exists as to whether the Act has met other fundamental objectives including the reduction of development in risky and biologically rich coastal barriers. Some units in the CBRS have developed significantly despite the Act’s restrictions. Future studies should investigate the nature of and extent of development that has occurred in coastal barriers within and outside the System. Furthermore, the report recommends implementation of appropriate state and local policies to bolster the Act’s impact.

**Keywords:** Unified National Program

**Abstract:** This review was conducted to inform Congress about the effectiveness of a unified national program for reducing losses due to floods, as proposed by a task force established by the President in 1966. GAO found that little progress has been made toward curtailing disastrous flood losses by planning for and controlling the uses of flood-prone lands. Development of such lands has continued, making the program’s objective more difficult to achieve. The main reasons cited for the lack of progress are: (a) the lack of adequate evaluation of federal agencies, (b) the lack of adequate technical assistance from federal agencies on planning and regulating the use of flood-prone lands, (c) the need for better monitoring and leadership for federal flood control efforts, and (d) the need for more cooperation between federal, state and local governments to minimize flood losses.

Keywords:
compliance, development, enforcement, legislation, mandatory purchase, Oklahoma

Abstract: GAO evaluated the nature and extent of development in Tulsa’s Mingo Creek floodplain between February 15, 1972 (when the city adopted floodplain management regulations) and December 15, 1974. This report examines the effectiveness of federal, state, and local monitoring procedures designed to prevent improper development. GAO identified all loans for acquisition or construction of property in the Mingo Creek floodplain to determine whether mandatory flood insurance was required and had been obtained. GAO also examined NFIP policies, procedures, and legislative history. The final aspect of the study included interviews with federal, state, and local officials responsible for implementing the program as well as officials at financial institutions and the National Flood Insurers Association Serving Office. GAO recommends five changes to increase the NFIP’s effectiveness: (a) approve legislation that would prohibit federally regulated financial institutions from purchasing mortgages in the secondary market on properties that are required to but do not have flood insurance; (b) require communities to demonstrate adequate procedures for enforcing floodplain management regulations as part of admission into the NFIP; (c) establish a monitoring system to ensure that communities comply with adopted regulations; (d) clarify FIA regulations on communities proposing changes to floodplain levels; and (e) require future development in floodplains to be 1 foot above the 1 percent annual chance flood level. This report includes FIA’s response to each of the recommendations and actions to be taken.

Keywords:
compliance, legislation, mandatory purchase, mapping, NFIP

Abstract: This report examines efforts of the Department of Housing and Urban Development (HUD) to implement the Flood Disaster Protection Act of 1973. GAO’s extensive analysis of the NFIP for this report included: a review of pertinent policies, procedures, studies, and legislative history; interviews with federal, state, and local officials and FIA contractors responsible for implementing the NFIP; and visits to nine communities in five states to review local efforts to implement program requirements. GAO found that: (a) flood insurance studies and rate maps were not being produced at a rate to meet the August 1, 1983, deadline for having all flood-prone communities participating in the regular phase of the NFIP; (b) FIA needs to better monitor community efforts to adopt and enforce floodplain management regulations; (c) flood insurance was generally being obtained when any federal financial assistance was required (about 90 percent of mortgage transactions tested); (d) federal policy on secondary market purchases is often inconsistent and needs to be clarified. The report includes responses from HUD, FIA, and other federal agencies impacted by the recommendations in the report.

Keywords:
disaster assistance, enforcement, Farmers Home Administration (FmHA), mandatory purchase, Small Business Administration

Abstract: GAO reviewed the disaster loan programs of the Farmers Home Administration (FmHA) and the Small Business Administration (SBA) to examine the procedures used by federal agencies to ensure that disaster loan recipients maintain flood insurance when required as a condition for such loans. GAO reviewed legislation, agency policies, procedures, regulations, and guidelines in addition to gathering statistics on repeat flooding, flood insurance policies, and FmHA and SBA flood disaster loan activities since Fiscal Year 1975. Neither of these agencies nor FEMA had adequate information concerning the number of communities suffering repeat flooding, the number of loans requiring mandatory flood insurance made in SFHAs, and the number of borrowers required to buy flood insurance who had failed to renew or had their insurance cancelled before the final repayments of their loan. Therefore, GAO could not determine the extent of actual or potential losses to the government and to borrowers from failure to maintain flood insurance. Since neither of the legislative acts covering flood and disaster relief specifically addresses second loans to individuals failing to maintain required insurance on previous loans, FEMA, FmHA, and SBA have established their own policies and regulations on subsequent assistance. Some inconsistency in the practices of the three agencies exists. FEMA has certain corrective actions planned to combat the current lack of adequate information at the community and borrower levels. FmHA had adequate procedures to protect the government's interest by ensuring that flood insurance is maintained where required. SBA practices appear to be less than adequate in that the agency does not have contingency procedures that allow it to pay the insurance premium if the borrower fails to renew.

Keywords: compliance, floodplain management, mapping, NFIP, 1 percent annual chance flood standard

Abstract: This report was conducted to identify problems affecting program administration and the attainment of legislative objectives. GAO interviewed FIA staff at headquarters and three regional offices, met with state and local floodplain officials, and obtained information from federal agencies and several private sector experts. The report makes several key findings: the mapping program continues to have problems, floodplain management needs more emphasis, communities require more assistance to implement the program, the 1 percent annual chance flood standard needs evaluation, and the monitoring program requires improvements. Furthermore, some FIA policies, such as permitting the replacement of structures in the floodway, appear to be contrary to the objective of minimizing future flood damages. GAO recommends possible programmatic changes in response to each of the problems identified. For example, FIA should establish a cost-sharing arrangement with localities for (re)mapping work. In almost all cases FIA agreed to investigate the feasibility of implementing the report’s recommendations.

Abstract: This report examines the federal government’s financial role in disaster assistance to determine what the role and the relevant guiding principles should be. It discusses the five major disaster assistance programs, which include: the Small Business Administration’s disaster loan program, the Farmer Home Administration’s emergency loan program, the Disaster Payments Program (Department of Agriculture), the Federal Crop Insurance Program (administered by the Federal Crop Insurance Corporation), and the NFIP. These five programs provide three generic forms of subsidized assistance: loans, grants, and insurance. GAO believes the following general criteria should be recognized in designing disaster assistance programs: (a) incentives should be minimized for poor locational decisions; (b) likes should be treated alike within programs, across programs, and over time; and (c) no individual or group should be able to improve on their predisaster condition unless it would reduce future government cost.

Abstract: Since 1970, the President’s Disaster Relief Fund has provided $3.8 billion to individuals and state and local governments. FEMA, in assessing the eligibility for disaster assistance, has had difficulty in determining whether state and local governments are capable of handling their own disasters and whether they are committing a reasonable amount of their available funds for disaster relief. GAO also found that FEMA has adopted a controversial cost-sharing policy and has funded disasters other than natural ones. GAO recommends that Congress clarify the extent of supplemental federal assistance to be given and the kinds of disasters that are eligible for federal assistance. FEMA should analyze the impact potential state inequities have on federal disaster assistance and submit a detailed plan and legislative changes to Congress to correct such weaknesses.

Abstract: This report compares the rate of community development and availability of flood insurance in six communities. GAO looked at 10 years of data on the number of new housing units authorized for each community and interviewed 115 people. None of the interviewees said they viewed flood insurance as the principal factor in development but almost all said it aided development since it was a “sweetener” in lessening investment risks. Many of those interviewed said that the availability of flood insurance had affected their community by increasing financial security and by forcing higher construction standards. Both factors were viewed as “enhancing” development. Nothing in the program effectively discourages new development. With increasing
growth in coastal areas, GAO felt the risk of loss was inevitably growing and concluded that there is no assurance that the structures would safely survive a major storm, so it may be bad public policy to continue to provide coverage in coastal areas. The report also notes that a multitude of factors influences a builder to construct, an individual to occupy a structure, or a businessman to locate in a coastal or barrier island community. These factors include demand for location on highly desirable beach property, viability of local economies, and availability of community infrastructure. The report observes that the NFIP offers a “marginal added incentive” to development.

Keywords: agency operations and management, mapping

Abstract: GAO reports that FEMA will not meet the August 1983 deadline contained in the National Flood Insurance Act of 1968 for mapping flood hazards for all flood-prone communities. The primary reasons for such a failure include the unexpected magnitude of the undertaking and the nonuse of less costly and time-consuming alternative techniques for producing rate maps. GAO concluded that Congress should consider and select an optimal approach to complete the mapping project.

Keywords: insurance premiums, insurance purchase decision

Abstract: In response to a congressional request, GAO reviewed the impact that recent rate increases had on individual and community participation in the NFIP. GAO found that in the first two years after FEMA raised rates in January 1981, individual participation declined. Participation fell from a peak of about 2,014,500 policies in December 1980 to about 1,860,400 in November 1982. GAO identified several factors in addition to the rate increases that could have contributed to the decline in individual participation. These factors include: (a) the decline in the housing market during the last few years; (b) the smaller number of floods and flood losses experienced in the last few years; and (c) the general economic recession. During this period, six small communities left the program. GAO found that none of the six communities left the program because of the rate increases. Rather, their reasons for leaving the program included the building restrictions imposed by the floodplain management criteria, a belief that there was not a need for flood insurance, and communities’ dislike of having the federal government tell them what they could and could not do in their flood-prone areas.

Keywords: economic modeling, insurance premiums, subsidies

Abstract: GAO reports that the NFIP has not collected sufficient premiums to cover the cost of providing the insurance of about 1.9 million policyholders living in flood-prone areas. To compensate for the inadequate premium income, FIA borrowed $854 million from the U.S. Treasury between 1970 and 1980. This report says that FEMA has relied on a combination of models and judgment to set the insurance rates, but methodological and data weaknesses in this approach have produced an overly complex rate structure that has not generated sufficient income to cover the costs of providing insurance or build up a reserve. The report notes FEMA’s intention to eliminate the federal subsidy by 1988. GAO recommends that Congress consider telling FEMA whether it agrees with the agency’s shift toward rate increases or coverage reductions. GAO also recommends that FEMA establish a monitoring program to detect any adverse impact that increases in chargeable rates or decreases in coverage may have on the program’s objectives.

Keywords: basements, insurance coverage

Abstract: Effective October 1983, FIA limited insurance coverage for basements to reduce the NFIP’s payment of future claims. The limitation was initiated because FIA believed that flooding of basements represents a risk inconsistent with a sound insurance program and that the program should respond only to the basic needs of its policyholders. This fact sheet was written in response to congressional requests about: (a) FIA’s authority to make such a policy change; (b) the procedure used to justify the policy; (c) the legality of the notification process; and (d) why other alternatives were rejected. GAO found that FEMA had authority to decide what should be insured, the nature and limits of loss or damage, the classification of risks by type, and risk limitations and rejections. After reviewing the analysis used to make the decision about limiting basement coverage, GAO found that two of the three reports used did not mention basement flooding and while the examination of claims data may not have overstated losses due to basement coverage, FIA should have used more complete methods, including a survey of closed claims. GAO then examined the notification of policyholders about the new limitations placed on basement coverage, finding that federal courts had ruled the procedure was legally adequate. The fact sheet also presents information about why FIA did not select one of five other alternatives for modifying basement coverage.

Keywords:
insurance industry, Write Your Own Program

Abstract: In response to a congressional request, GAO reviewed the status of the Write Your Own (WYO) Program. GAO conducted interviews with officials at FIA, FEMA’s Office of Inspector General, Computer Sciences Corporation (the contractor that manages WYO companies), and WYO companies as well as a reviewed legislative history and program files. GAO determined that: (a) as of September 1986, there were over 1 million WYO policies, about half of all NFIP policies; (b) the relationship between allowances retained from policy premiums for administrative costs and benefits to the federal government is uncertain (FIA does not require WYO companies to keep records of their actual costs to implement the program, but most indicated that they incurred administrative expenses for various activities, including marketing.); and (c) FIA is still in the process of implementing statistical reporting requirements, on-site reviews, and audits to ensure that WYO companies sell and service policies in accordance with program requirements. GAO found that FIA’s monitoring indicates that most companies have satisfactorily implemented the program. WYO companies expressed concern about the WYO program. For example, WYO companies did not want to compete with FIA’s direct sales program. The companies also felt that FIA did not provide enough advance notice on insurance premium changes and that FIA would need to increase insurance rates in order to meet the program’s long-range goal of having them share claims costs.

Keywords: disaster planning, floodplain management, public assistance, risk communication, West Virginia

Abstract: In 1985, flooding in West Virginia killed 47 people; damaged or destroyed approximately 9,000 homes; damaged forest, farm, and park lands; and destroyed businesses and public facilities. The federal government declared 29 counties a major disaster area. The report provides information on the extent of local disaster planning and preparedness, the effectiveness of existing warning systems and plans to improve them, and the federal government’s responsiveness to victims’ needs. The report found that many West Virginia counties’ disaster plans did not meet FEMA’s emergency preparedness criteria because of insufficient staff and funds. Half of the state’s jurisdictions had emergency plans dated before 1975: FEMA guidance states that local emergency plans should be updated at least once every three years. More than two-thirds of the plans in the disaster counties were rated poor or very poor by the GAO review. Warning systems did not advise residents of hazards in adequate time to take safety precautions. Following the flood, the National Weather Service funded a system to improve flood predictions in the designated disaster counties. However, counties may lack the funds to maintain the system. GAO recommends that FEMA consider the merits of regional, rather than local, emergency planning and define limits for the length of time the public assistance application process should take. The document also contains comments from FEMA.

Keywords:
agency operations and management, coastal areas, insurance premiums, liability, mitigation, repetitive losses

Abstract: GAO compiled this fact sheet in response to a request for more information about the federal government’s role in protecting coastal resources and the exposure of the government to undesired levels of liability. GAO produced the statistics based on numbers provided by FEMA; the numbers were not independently verified. The statistics presented fall into six categories: (a) NFIP’s annual operating income/deficit, (b) number of policies in coastal areas and Great Lakes’ states, (c) total and repetitive losses, (d) flood-damaged property purchases by FEMA, (e) damages in excess of the maximum flood insurance available, and (f) annual average premiums and losses on policies for properties in coastal high-hazard areas. In 1987 the NFIP had about 2.1 million policies in-force, worth about $162 billion. In the period from 1978 to 1987 the NFIP had a cumulative net operating deficit of about $652 million, with losses totaling about $2.4 billion.

Keywords: enforcement, lending institutions, Maine, mandatory purchase, Texas

Abstract: This fact sheet addresses the views of FIA, regulatory agencies, and lenders on issues related to compliance with the mandatory purchase provision of the Flood Disaster Protection Act of 1973, the level of compliance in certain areas of Texas and Maine, and efforts to increase compliance. FIA and regulatory agencies disagree about the level of compliance with the mandatory purchase requirement. FIA believes the noncompliance rate may be substantial while regulatory agencies such as the Federal Deposit Insurance Corporation and Federal Reserve System report noncompliance as a relatively minor problem, chiefly involving technical matters. To measure the level of compliance in certain areas of Texas and Maine, GAO obtained information on all personal residences in SFHAs for which disaster assistance was requested. The analysis estimates that in Texas and Maine about 79 percent and 22 percent, respectively, of these residences did not have the required flood insurance. One reason cited by lenders, among others, for not requiring flood insurance involved policies lapsing on properties requiring flood insurance at loan origination. Finally, GAO provides information on efforts to increase compliance including regulatory agencies following up with lenders reviewed in Texas and Maine that did not require flood insurance. The fact sheet also outlines actions FIA and lending institutions take to decrease rates of noncompliance.

Keywords: disaster planning, Hurricane Hugo

Abstract: This report examines how FEMA and other federal agencies responded to California’s Loma Prieta earthquake and to Hurricane Hugo, which struck the U.S. Virgin Islands, Puerto Rico, and the Carolinas. The report contends that preparedness is the most critical aspect of
emergency management because it affects states’ ability to respond to disaster. Problems with preparedness were linked to weaknesses in state and local programs, as well as in FEMA’s assistance and overall guidance. These problems included inadequate planning and training for recovery, low participation by elected officials in training exercises, inadequate or no standard operating procedures for response and recovery activities, failure to correct problems identified during earlier training exercises, a limited number of staff having the necessary disaster assistance skills, and inadequate coordination between several federal agencies.

**Keywords:** environmental policy, federal programs, legislation, wetlands

**Abstract:** In recent years, the benefits of wetlands—such as providing habitat for fish and wildlife and abating erosion—have become better known. Unfortunately, an estimated 50 percent of all wetlands in the lower 48 states have already been filled or drained, and another 290,000 acres are being lost annually to agriculture and development. This fact sheet provides an overview of federal and state wetlands-related policies, legislation, and programs.

**Keywords:** Coastal Barrier Resources Act, Coastal Barrier Resources System, development, legislation, insurance coverage

**Abstract:** GAO states that while the Coastal Barrier Resources Act (CBRA) of 1982 and its successor, the Coastal Barrier Improvement Act of 1990 had effectively discouraged development in some areas, other areas had undergone significant new development and more was planned. The report notes that one part of the problem was lax compliance, noting that the NFIP did not have controls in place to assure that private insurers under the Write Your Own (WYO) Program were complying. Based on sampling in five units, GAO projected that the NFIP had written coverage for 9 percent of the homeowners in units of CBRS.

**Keywords:** disaster assistance, disaster planning, federal programs, Florida, Hawaii, Hurricane Andrew, Hurricane Hugo, Hurricane Iniki

**Abstract:** The nation’s management of disasters was strongly criticized after Hurricane Andrew leveled much of South Florida and Hurricane Iniki devastated Kauai in 1992. Even before these storms, the federal government’s response to major disasters like Hurricane Hugo and the Loma Prieta earthquake drew intense criticism. The government’s response to Hurricane Andrew, in
particular, raised doubts about whether FEMA was capable of responding to such catastrophes and whether it had learned any lessons from Hurricane Hugo and the Loma Prieta earthquake. GAO has testified repeatedly in 1993 on the inadequacy of the federal strategy for responding to disasters. This report summarizes GAO’s analyses, conclusions, and recommendations.

Keywords: disaster assistance, federal programs, insurance industry, insurance, legislation, liability, mitigation

Abstract: Although the insurance industry has absorbed losses from recent natural disasters without systemic failures, concerns exist about its ability to handle losses from potentially larger disasters. The federal government has absorbed a large portion of the losses from past disasters and is likely to pay out even larger amounts in the future. Proposed legislation in the Senate (S. 1350) would establish three interrelated programs: a multihazard disaster mitigation program, a primary insurance program for earthquakes and volcanic eruptions, and a reinsurance program to cap insurers’ losses when major disasters occur. This testimony explains in detail the provisions of S. 1350 and provides GAO’s analysis and concerns about the legislation. For example, GAO has great concern about the way the proposed federal reinsurance fund and the insurance industry would share losses. The basis for determining when the fund becomes liable for payment of disaster losses could be subject to insurer manipulation that could result in substantial increases to the fund’s liability.

Keywords: agency operations and management, insurance premiums, liability, subsidies

Abstract: This report addresses the actuarial soundness of the NFIP. GAO found that the program is intentionally not actuarially sound because Congress authorized subsidized insurance rates to be made available for policies covering certain structures, and, as of 1993, about 41 percent of policies were subsidized. With respect to the potential financial impacts of increasing subsidized flood insurance rates and enhancing program participation, both were determined to be potentially harmful. Increasing premiums would encourage policyholders to cancel their insurance and seek assistance through other federal disaster relief programs. However, encouraging participation in the flood insurance program would increase the amount of subsidized insurance rates, thereby worsening the NFIP’s financial condition. Finally, GAO describes the procedures used to set the program’s insurance rates.

before the Subcommittee on VA, HUD, and Independent Agencies, Committee on Appropriations, U.S. Senate. Washington, DC: GAO.

Keywords:
agency operations and management, disaster assistance

Abstract: This report discusses ways to enhance the effectiveness of a number of federal disaster assistance programs, identifies proposals to lower future federal costs, and addresses the accuracy of financial information in FEMA’s Disaster Relief Fund. Three main conclusions emerge. First, there are ways to improve federal disaster assistance programs, including greater flexibility on FEMA’s part in providing grant funding, enabling military reserve components to provide disaster assistance, and clarifying the conditions under which FEMA would pay more than the replacement cost to restore certain structures. Second, proposals have been made to modify and lower the costs of federal disaster assistance, including more explicit and/or stringent criteria for disaster assistance, emphasizing hazard mitigation through incentives, and relying more on insurance. Third, problems exist with FEMA’s current accounting systems, such as field office systems that are neither integrated nor linked to FEMA’s central accounting system.

Keywords:
Army Corps of Engineers, levees, Midwest floods of 1993

Abstract: In response to the Midwest floods of 1993 in nine states, Congress asked GAO to examine the operation of levees. This report addresses the extent to which: (a) the Army Corps of Engineers’ flood control levees prevented flooding and reduced damage during the event; (b) the federal levees increased the height of the flooding and added to the damage; and (c) federal, state, and local governments exercise control over the design, construction, placement, and maintenance of nonfederal levees. GAO found that most Army Corps of Engineers’ levees prevented flooding and reduced damage; levees increased flood levels but represented one of many factors affecting the extent of flooding; and federal, state, and local governments exercise some control over nonfederal levees.

Keywords:
cost-benefit analysis, disaster assistance, public assistance

Abstract: This report reviews FEMA’s public assistance program, which funds the repair of eligible public facilities – such as roads, government buildings and utilities – that are damaged in natural disasters. This report evaluates FEMA’s criteria for determining eligibility for public assistance, FEMA’s monitoring of public assistance expenditures, and potential changes in eligibility that could lower the costs of public assistance. FEMA’s criteria for determining eligibility of certain nonprofit facilities were deemed ambiguous and regional officials were not
systematically updated of policy changes. States are largely responsible for ensuring that expenditures are limited to eligible items. Independent audits by FEMA’s OIG and some state audit staff provide an additional check on eligibility. When surveyed, public assistance program officials at FEMA’s regional offices recommended limiting the time period and number of appeals for building restoration, eliminating the eligibility of facilities owned by redevelopment agencies, and restricting eligible public facilities to only those being actively used for public purposes.

Keywords: agency operations and management, public assistance

Abstract: In this report, GAO reviews FEMA’s criteria for determining eligibility for public assistance, determines how FEMA ensures that public assistance funds are expended only for eligible items, and identifies changes in eligibility that could lower the costs of public assistance in the future. GAO reports that FEMA’s criteria for determining public assistance are ambiguous and that FEMA has systematically updated or disseminated to regional officials its policy changes affecting eligibility. FEMA relies principally on states to ensure that expenditures are limited to eligible items. Program officials in FEMA’s 10 regional offices identified a variety of options that, if implemented, could reduce the cost of the public assistance program, including placing limits on the appeals process; eliminating eligibility for some facilities that generate revenue, lack required insurance, or do not deliver government services; and limiting the impact of codes and standards.

Keywords: enforcement, federal programs, mitigation, risk assessment

Abstract: This testimony briefly discusses why state and local governments and individuals do not always undertake disaster mitigation efforts. Reasons include local sensitivity to measures such as building codes enforcement and land-use planning, conflict between mitigation and developmental goals, and individuals’ perceptions that a disaster has a low possibility of occurring. FEMA’s efforts to encourage mitigation include grants and training for state and local governments, funding for mitigating damage to public facilities and purchasing and converting flood-prone properties to open space, federal flood insurance, and programs targeted at reducing the loss of life and property from earthquakes and fires. The effort for ensuring the cost-effective use of federal dollars for hazard mitigation is hampered by the need for better data to estimate risks and by the fact that funds for hazard mitigation are provided through a number of different programs and agencies—some limited to particular hazards. However, savings from such
programs depends upon the incidence of future disasters and the extent to which the federal
government would bear the resulting losses.

Enforcement Programs on Results. Report to Committee on Commerce, US House of
Representatives, Washington, DC: GAO.

Keywords:
agency operations and management, compliance, Environmental Protection Agency, floodplain
management, legislation

Abstract: Environmental statutes allow the Environmental Protection Agency (EPA) to delegate
responsibility for key enforcement programs to qualified states. States may supplement these
programs with other approaches to improve compliance through technical assistance and
incentives. The report addresses what alternative compliance strategies states are practicing, how
states are measuring the effectiveness of these strategies, and the influence of the EPA. The EPA
has historically measured the success of states’ enforcement programs by the number of
inspections conducted and the number of enforcement actions taken against violators. Recently,
however, states have cited these “output-measures” as inappropriate indicators of a program’s
success that ignore needs for technical assistance and education. GAO found that states typically
implemented programs to aid in compliance with environmental regulations, or programs that
promote more flexible enforcement than is practiced under the current system. State and EPA
officials agreed that alternative compliance strategies should be measured and assessed.
However, there are several obstacles to measuring performance outcomes, such as the absence of
baseline data. EPA has initiated several activities to aid states’ efforts but has also encountered
differences between its own legal and policy approaches and those of states. GAO found that
different EPA offices assessed state enforcement programs differently as well, making
cooperation difficult. Despite quarterly meetings between management staff in headquarters and
regional offices and the implementation of the National Performance Measures Strategy, officials
acknowledged that states are still receiving inconsistent messages.

Keywords:
federal programs, wetlands

Abstract: The report is the response to a request to develop an inventory of federal agencies
involved in wetlands-related activities between fiscal years 1990 and 1997 and to determine if
data on wetlands acreage reported by these agencies are consistent and reliable. GAO found that
36 federal agencies, to varying degree, conducted wetlands-related activities during the time
period, including acquiring, regulating, restoring, enhancing, mapping, delineating, and
researching wetlands. Funding associated with these activities ranged from $508 million to $787
million and staffing ranged from 3,271 FTEs to 4,308 FTEs. Six agencies – the Army Corps of
Engineers, the Department of Agriculture’s Farm Service Agency and the Natural Resources
Conservation Service, the Department of the Interior’s Fish and Wildlife Service, the Department
of Commerce’s National Oceanic and Atmospheric Administration, and the Environmental
Protection Agency – were the primary agencies involved in and responsible for implementing wetlands-related programs. These six agencies accounted for more than 70 percent of the funding and 65 percent of the staffing associated each year with such activities. GAO found that the consistency and reliability of wetlands acreage data reported by federal agencies were questionable. The consequence of this is that no single set of wetland acreage figures could be used to evaluate the progress made in achieving the goal of no net loss. Current reporting practices do not allow the number of acres restored or enhanced to be determined. Programs intended to improve on wetlands management and data have been proposed, but not fully developed and implemented.

Keywords: cost-benefit analysis, Hazard Mitigation Grant Program, mitigation

Abstract: This statement describes the approaches FEMA and the states use to ensure that the Hazard Mitigation Grant Program’s awards are targeted to cost-effective mitigation projects. It presents GAO’s findings as to whether the approaches ensure that the mitigation measures are cost-effective. GAO found that all the states conducted cost-benefit analyses to determine projects’ cost-effectiveness. Although FEMA does use cost-benefit analysis as its primary approach for ensuring cost-effectiveness, it also exempts certain types of projects from this analysis because of difficulties in quantifying their benefits and the time needed to gather data for conducting the analyses. GAO determined that the hazard mitigation projects receiving the majority of the funding are cost effective. However, projects receiving one-third of the funding were exempt from cost-benefit analysis, despite the absence of the established analytical basis supporting the exemption of a majority of these projects.

Keywords: cost-benefit analysis, Hazard Mitigation Grant Program, mitigation

Abstract: GAO reviewed how FEMA, together with individual states, ensures the cost-effectiveness of projects under the mitigation grant program. GAO found that the states and FEMA work together to help ensure that program grants are awarded for cost-effective projects. The states, according to GAO’s review, established procedures and priorities for identifying and selecting mitigation projects, but not all of them conducted a formal analysis of a project’s cost-effectiveness before submitting an application for the project to FEMA.

Housing and Community Opportunity, Committee on Banking and Financial Services, House of Representatives. Washington, DC: GAO.
Available at: http://www.gao.gov/new.items/d01992t.pdf
NOTE: GAO gave similar testimony before the Committee on Banking, Housing, and Urban Affairs, U.S. Senate, in August 1999. This testimony appears in a separate GAO document not cited in the bibliography.

Keywords:
insurance premiums, liability, NFIP, subsidies

Abstract: In this testimony, GAO discusses the factors contributing to financial difficulties of the NFIP as of 1998 and the potential effects of corrective actions by FIA. A GAO report from March 1994 found that NFIP funds were sufficient to cover current program expenses but were susceptible to future flood losses. Between 1993 and 1998, claims increased as a result of losses from a series of storms, including the 1997 floods in the Red River Valley. Program losses totaled $1.6 billion. To cover this cost, FIA borrowed funds from the U.S. Treasury and owes $738 million as of March 31, 1999. The GAO report finds several reasons for the deficit. Dependence on premiums for funding prevents the NFIP from anticipating the cost of future losses. Repetitive loss properties account for claims disproportionate to their number or premiums. Annual premiums on subsidized policies, though nearly twice the annual premiums on actuarial policies, represent only 38 percent of the true risk premium of the policy. FIA aims to collect sufficient revenue to meet the expected losses and expenses of the average historical loss year, as well as cover the program administration. However, the calculation of the average historical loss year is based only on experience under the program since 1978. To address the financial health of the NFIP, FIA has studies underway to assess the potential effects of eliminating subsidized properties and targeting the repetitive loss properties that pose the greatest cost. The report recognizes that losses experienced by the program have gradually declined since fiscal year 1995 and that financial status is an imperfect indicator of the value of the program. Standards for new construction reduce the potential cost of future losses and subsidized premiums encourage program enrollment, decreasing taxpayer-funded disaster relief.

Keywords:
federal programs, Maryland

Abstract: This report is in response to a request for information about a new facility for the Food and Drug Administration in College Park, MD, located in a floodplain. The report found that the facility met the minimum requirements set by the state of Maryland for a building with a basement in a flood plain. The total cost of the building and land is estimated to be about $86 million. The basement contains the building’s main computer facilities, which stores for the Center for Food Safety and Applied Nutrition. Flooding of the computer facility would result in damages close to $4 million.

Abstract: The Tennessee Valley Authority (TVA), a government corporation, has harnessed the Tennessee River and its tributaries to serve various purposes from recreation to flood control to hydroelectric power production. Thirteen of TVA’s projects along the river, known as multipurpose tributary projects, consist of dams and lakes on the river’s tributaries, such as the Douglas and Cherokee projects and provide multiple public benefits. In operating its integrated system, TVA often finds that the multiple purposes served by the project can conflict and/or compete with each other. This report discusses: (a) the purposes served by TVA’s multipurpose tributary projects and how TVA operates them within its integrated system; (b) the operational changes TVA made to these projects as a result of its December 1990 review of its project operations and the major factors influencing these changes; (c) the steps TVA has taken since 1990 to address requests for changes in the way it operates these projects; and (d) TVA’s plans for future changes in the way it operates these projects.

U.S. General Accounting Office (GAO). (2000). Disaster Assistance: Issues Related to the Development of FEMA’s Insurance Requirements. Report to Congressional Committees. Washington, DC: GAO. Available at: http://frwebgate.access.gpo.gov/cgi-bin/useftp.cgi?IPaddress=162.140.64.21&filename=g800062.pdf&directory=/diskb/wais/data/ga Keywords: agency operations and management, disaster assistance, public assistance
Abstract: FEMA has proposed that funding under the Public Assistance Program for buildings damaged in a disaster be limited to those state and local agencies and other public entities that maintain specified minimum levels of insurance coverage. According to FEMA, the draft regulation is intended to remove a disincentive under current rules for such entities to both carry insurance and manage their risk of disasters. This report evaluates the agency’s efforts to develop its draft insurance regulations. GAO 1) determines the extent to which FEMA obtained and incorporated input for state and local agencies and public entities likely to be affected by the draft regulation; 2) evaluates FEMA’s compliance with Executive Order 12866, the Regulatory Flexibility Act, and applicable guidance governing the rulemaking process; and 3) assesses FEMA’s internal rulemaking processes and procedures. Based on its review, GAO found that FEMA took a number of steps to obtain and incorporate input on the content of its draft and, based on this input, made changes to its draft regulation, but the agency failed to fully comply with Executive Order 12866 because it had not performed an analysis of the expected costs and benefits of the draft regulation and had not prepared a comprehensive analysis of other alternatives. Many of problems observed by GAO appeared to come from weaknesses in FEMA’s internal rulemaking processes and procedures. For example, FEMA had not designated a regulatory policy officer and had not updated its internal guidance and procedures governing the formulation of proposed rulemaking in more than 10 years.

302
Abstract: The report addresses the extent to which variations exist among the Environmental Protection Agency’s (EPA) 10 regional offices in their enforcement of environmental regulations, what factors contribute to variations, and what is being done to achieve consistency. Enforcement of environmental regulations is administered through the Office of Enforcement and Compliance Assurance (OECA). OECA expects the regions to take a systematic approach to administering and overseeing enforcement programs, in accordance with EPA regulations. Consistency among regions has implications for the application of comparable enforcement responses to like violations. However, EPA acknowledges that some variation among regions is expected because of available resources and the level of regional oversight for state enforcement programs. GAO found variations in inspection coverage of facilities discharging pollutants, the number and type of enforcement actions taken, the size of penalties assessed, and the criteria used in determining penalties assessed. Nor are these variations new or unknown: the results corroborate earlier findings by EPA’s Office of the Inspector General (OIG) and others. Interviews with regional officials confirmed the lack of consistency. EPA headquarters and regional officials have a number of efforts underway to achieve greater consistency. For example, headquarters is organizing a series of “Program Status Reports” to communicate regional performance information. However, EPA predicts that the absence of reliable data will continue to hamper consistency.

Keywords: FEMA management
Abstract: The review examines each of FEMA’s performance goals related to key outcomes, assesses whether it has been met, what progress has been made to meet it, whether systems are in place to measure progress, and what obstacles exist to achievement of goals. Based on review of FEMA’s 1999 annual performance report, GAO found that FEMA is making progress to addressing its goals, but that the reasons for not meeting some goals were not clear, and FEMA did not describe a strategy to meet those goals in the future. FEMA had recently developed a quarterly reporting system for tracing progress to meeting performance goals. FEMA officials stated that the system is used to influence decision-making. GAO also noted that some FEMA goals are described in qualitative terminology that makes progress difficult to determine and measure. The report concludes that FEMA has made considerable progress to resolving management challenges.

Keywords:
disaster assistance, public assistance

Abstract: The report analyzes FEMA’s criteria for determining eligibility for disaster assistance, and the effect of implementation of changes in eligibility requirements. Since 1990 FEMA has expended over $27 billion in disaster assistance. Federal funds for disaster assistance are provided on the basis of whether costs exceed a fixed cost per capita statewide. The report finds that these criteria are not indicative of a state’s financial capacity to respond to a disaster, merely the impact of the disaster in relation to population. Also, while FEMA has continued to develop clear criteria for determining the eligibility of individual projects, difficulties in applying these criteria persist because of the temporary nature of many of the field staff and the lack of sufficient training. FEMA has delayed implementing a credentialing program because of budgetary and programmatic factors. The lack of centralized, quantified, reliable data also hampers the ability of FEMA officials to conduct program-wide analysis of the public assistance program.

Keywords:
agency operations and management, disaster assistance, disaster planning, mitigation, strategic planning

Abstract: FEMA’s performance in achieving key outcomes in fiscal year 2000 was analyzed as required by the Government Performance and Results Act of 1993. The report finds continued improvement in the selected key outcomes: to minimize human suffering and property losses after natural disasters, provide timely responses to disaster aid requests, and prevent or reduce harm and losses from future disaster through mitigation efforts. The report concludes that the performance goals that FEMA uses to measure progress in these three areas are largely accurate and effective in encouraging program improvement. The report also reviews FEMA’s projected handling of strategic human capital management and information security through its 2002 performance plan.

Keywords:
agency operations and management, compliance, mapping, Special Flood Hazard Areas, strategic planning

Abstract: In this prepared statement, GAO specifically addresses whether FEMA could better evaluate the NFIP’s results by adding a goal tied to rates of participation in the program—the percentage of structures in SFHAs that have insurance; and what obstacles and opportunities
exist for measuring these participation rates. While FEMA does have several performance goals used to evaluate the NFIP’s effectiveness, the agency does not assess participation rates of residents living in flood-prone areas. By collecting data on the number of insured and uninsured structures in flood-prone areas, FEMA could assess how effectively the program penetrates areas at risk for flood damage and could better target its marketing efforts. However, before participation rates can be used to measure the success of the NFIP, better data are needed on the total number of structures in flood-prone areas. Currently, data on the number of structures are incomplete and inaccurate. GAO notes that FEMA is working to improve the quality of these data with the use of, for example, new mapping technologies.

Keywords: insurance premiums, NFIP, repetitive losses, subsidies

Abstract: In this prepared statement, GAO addresses three issues: 1) the financial results of the program’s operations since Fiscal Year 1993, 2) the program’s actuarial soundness, and 3) the impact of repetitive loss properties and FEMA’s strategies for reducing those losses. GAO reports that the NFIP operated “in the black” for past two fiscal years, which enabled the program to repay funds it had borrowed from the U.S. Treasury to finance earlier losses. With regards to actuarial soundness, the report finds the NFIP does not collect sufficient premium to build reserves to meet future expected flood losses. As of 2000, approximately 30 percent of policies received subsidized rates. Furthermore, repetitive loss properties have a major disproportionate impact on the program, currently accounting for about $200 million in losses annually. Based on its findings, GAO presents policies FIA could adopt to correct programmatic deficiencies. For example, the NFIP could achieve actuarial soundness through a rate-setting process that would consider the monetary risk exposure of the program or the dollar value of expected flood losses over the long run. In addition, GAO also supports FIA’s efforts to identify target repetitive loss properties and transfer their servicing to a special facility designed to better oversee claims and coordinate and facilitate insurance and mitigation actions and to develop and implement proposals to reduce the subsidy provided to pre-FIRM repetitive loss properties.

Keywords: lending institutions, mandatory purchase

Abstract: This report presents the opposing perspectives held by bank regulators and government-sponsored enterprises (GSEs) and FEMA regarding lender compliance with flood insurance purchase requirements. Federal agencies responsible for overseeing lenders have uncovered few significant violations of lender noncompliance in their reviews of loan portfolios. Meanwhile, FEMA suspects significant lender noncompliance rates based on data, past studies,
and anecdotal evidence. GAO obtained and analyzed 1999 data on new loans and new flood insurance policies for 471 highly flood-prone areas in 17 states. The data do not indicate a major noncompliance problem at loan origination. For example, only 9 percent of the locations included in the study revealed a higher number of mortgages originated than flood insurance policies sold. According to GAO, a full measure of compliance would require property-specific data on mortgages, flood zone determinations, and flood insurance policies compiled at loan origination and at subsequent points during the life of the loan. However, several technical and political challenges encumber the achievement of such a measure.

Keywords: federal programs, Hazard Mitigation Grant Program, mitigation, Project Impact

Abstract: As the lead agency for providing federal disaster relief, FEMA has provided the bulk of the assistance to help those in need respond to and recover from disasters. The most significant of the agency’s mitigation programs are the postdisaster Hazard Mitigation Grant Program (HMGP) and Project Impact. Some criticism has emerged in recent years about the impact of these FEMA programs. In response, FEMA’s Fiscal Year 2003 budget request proposes changes to the multihazard mitigation programs that are intended to improve the effectiveness of mitigation efforts. These changes would combine the programs into a single predisaster mitigation program that awards grants for mitigation activities on a nationwide, competitive basis. Based on its analysis, GAO raises the following concerns about the proposal: 1) FEMA might not be able to take advantage of interest in participating in mitigation activities that often emerges after a disaster, 2) some states might be entirely excluded from mitigation funding, 3) outreach and planning activities that help increase participation in mitigation might be curtailed, and 4) FEMA might face challenges, such as establishing a process for comparing the costs and benefits of projects, in implementing the new program. Furthermore, some people are concerned that heightened focus on homeland security will result in less focus on natural hazard mitigation activities.

Keywords: federal programs, insurance, mitigation, NFIP, strategic planning

Abstract: GAO reviewed the Fiscal Year 2001 performance reports and the Fiscal Year 2003 performance plans of two agencies—Agriculture and FEMA—both of which generally address coordination efforts regarding the issue of flood mitigation. Agriculture reported that it did not meet its only Fiscal Year 2001 goal related to flood mitigation—providing benefits to property and safety through flood damage reduction by completing 81 watershed protection structures. One reason cited for this failure involves the complex engineering required to complete such
structures. FEMA reported meeting all but one of its Fiscal Year 2001 goals and indicators related to flood mitigation and insurance. FEMA did not increase the number of NFIP policies in force by 5 percent in Fiscal Year 2001 because retention rates for existing policies were not maintained. In its Fiscal Year 2003 plan, FEMA adopted a new goal related to modernizing its floodplain mapping. Agriculture appears to have dropped its target for completing new watershed protection structures and instead plans to implement a new program of rehabilitating aging dams. Overall, the strategies Agriculture and FEMA plan to use appear to be reasonably linked to achieving their Fiscal Year 2003 goals.

**Keywords:** mandatory purchase, mapping, NFIP, repetitive losses, subsidies

**Abstract:** In this report, GAO finds the NFIP faces several challenges in operating the program effectively and protecting property owners from flood losses. For example, to improve information on the NFIP’s financial condition, GAO recommends the program abandon its current cash-based budgeting and adopt accrual-based budgeting. Accrual-based budgeting better matches revenues and expenses, recognizes the risk assumed by the government, and has the potential to overcome the deficiencies of cash-based budgeting. GAO also comments on how policy subsidies and repetitive loss properties adversely affect the NFIP’s financial condition. About 29 percent of policies in force receive subsidies but none of these subsidies receives appropriated funds. Further, repetitive loss properties account for 2 percent of insured properties but represent 38 percent of claims losses. Finally, the NFIP needs to increase property owner participation rates. The administration estimates less than 50 percent of eligible properties participate in the program. Increasing participation rates may pose difficulties because the recent placement of the NFIP within the Department of Homeland Security has the potential to decrease the attention, visibility, and support the program receives.

**Keywords:** federal programs, Hazard Mitigation Grant Program, insurance, mandatory purchase, mitigation, NFIP, Project Impact

**Abstract:** This report is part of a special GAO series entitled the *Performance And Accountability Series: Major Management Challenges and Program Risks*. The 2003 series includes the first report on FEMA since the series began in 1999. FEMA’s mission will be absorbed into the Department of Homeland Security. As FEMA moves to integrate its mission into this department, the agency faces several management challenges including the condition of its mitigation and flood insurance programs. Specifically, GAO reports on FEMA’s Fiscal Year 2003 budget request, which proposes a consolidation of the Hazard Mitigation Grant Program (HMGP) and the former Project Impact. The proposed consolidation could raise additional
challenges to participation in and implementation of the mitigation program. Concerning flood insurance, GAO notes the actuarial unsoundness of the NFIP and the program’s failure to collect sufficient premium income to build reserves to meet the long-term future expected flood losses. In addition to these concerns, the level of compliance with the requirements for the mandatory purchase of flood insurance is unknown. Nevertheless, GAO believes FEMA can reduce the impact of natural hazards by improving the efficiency of its mitigation and flood programs.

**Keywords:**
agency operations and management, federal programs, legislation

**Abstract:** The report addresses the success of the Government Performance and Results Act (GPRA) in shifting the focus of government operations from process to results and the extent to which agency managers have embraced GPRA as a management tool. GPRA was enacted in 1993 and provides a foundation for examining agency missions, performance goals and objectives, and results. GAO finds that GPRA has built the necessary infrastructure to generate meaningful performance information. For example, GPRA has required federal agencies to consult with Congress and key stakeholders to reassess their missions and long-term goals and the strategies and resources to achieve them. The federal government is in the process of moving toward a more difficult phase of GPRA implementation – using results-oriented performance information as a part of agencies’ day-to-day management and decision-making. This will require transforming agencies’ organizational cultures, developing performance goals and collecting performance data, and addressing fragmentation and overlap. The report suggests options for improving the use of GPRA, including developing government-wide strategic performance plans and establishing chief operating officers within agencies.

**Keywords:**
map modernization, mapping

**Abstract:** GAO was asked to review the progress of FEMA’s map modernization program, a $1 billion, 5-year update of floodmaps. GAO found that FEMA needs to take steps to differences between communities that may affect the program’s implementation. For instance, though FEMA has ranked the nation’s 3,146 counties from highest to lowest risk, it has not established data standards that designate the appropriate level of detail accuracy and analysis for the development of digital maps. Without clear standards, FEMA cannot ensure that it uses the same level of data collection and analysis for communities facing similar risks. Additionally, FEMA has not yet developed a clear strategy for partnering with communities with few resources and little or no experience in flood mapping. FEMA’s success in implementing the Map Modernization program depends on its ability to utilize communities’ resources and account for deficiencies.

**Keywords:** legislation, repetitive losses

**Abstract:** The report documents FEMA’s recent actions to reduce program losses related to repetitive loss properties. These include FEMA’s strategy to target severe repetitive loss properties for mitigation and congressional proposals to phase out coverage or begin charging full and actuarially based rates for property owners who refuse to accept FEMA’s offer to mitigate their structures. The proposal would increase premium rates by 50 percent if the property owners subsequently made a claim to the program exceeding $1,500. In the opinion of GAO, these steps have the potential to reduce the number and vulnerability of repetitive loss properties, as well as the number of flood insurance claims. The appendices include data on the number and amount of losses for repetitive loss properties by state.

**Keywords:** Hurricane Katrina, actuarially sound, repetitive losses, mandatory purchase

**Abstract:** By design, the NFIP is not actuarially sound. The program does not collect enough premium income to build reserves for long-term future flood losses; however, FEMA kept the NFIP generally financially sound until the four Florida hurricanes of 2004 and the resulting catastrophic flooding. To pay 2004 claims, FEMA borrowed $300 million to help pay an estimated $1.8 billion in 2004 claims. Now after Katrina, FEMA’s borrowing authority has been increased by $2 billion. Repetitive loss properties are a significant drain on NFIP resources. Future studies should analyze the reduction in the inventory of subsidized repetitive loss properties. Mandatory homeowner purchase of flood insurance legislation was enacted in 1973 and 1994; however, GAO reported in 2002 that they were not able to determine the extent of compliance with the law.

**Keywords:** Flood Insurance Reform Act of 2004

**Abstract:** FEMA had not yet implemented provisions of the Flood Insurance Reform Act of 2004 that required the agency to provide policyholders with a flood insurance claims handbook, to establish a regulatory appeals process, and to ensure that insurance agents meet minimum NFIP education and training requirements. Efforts to implement the provisions are underway, but not complete. Statutory and other limits to NFIP coverage may result in insurance payments that do not cover the full costs of repairing or replacing flood-damaged property. FEMA did not use a
statistically valid method for sampling insurance files for oversight review of insurance companies that sell NFIP flood insurance, so therefore FEMA could not fully assess the overall performance of the companies and adjusters to make sure they are complying with NFIP program goals.

**Keywords:**
- flood map modernization

**Abstract:**
FEMA is planning to modernize flood mapping by using advanced technology to gather accurate data and to publish the maps on the Internet. FEMA expects that more accurate and accessible flood maps will enable communities to reduce floodplain flood risk; will help homeowners identify their flood risk; and help government officials mitigate and manage risk. However, FEMA has not yet established clear standards for the data needed to establish different levels of flood risk. FEMA’s 2004 Multi-Year Flood Hazard Identification Plan contains FEMA’s strategy for using varying types of flood hazard data collection and analysis techniques.

**Keywords:**
- flood insurance agents

**Abstract:**
As a result of policy limits, restrictions and exclusions, insurance payments to claimants for flood damage may not cover all the costs of repairing or replacing damaged property. Selling and servicing NFIP policies and adjusting NFIP claims is carried out by private sector insurance agents and adjusters, subject to FEMA oversight. Flood insurance adjusters have mandatory training requirements, but agents do not. FEMA has oversight mechanisms in place to review the operations and work of insurance companies and adjusters.

**Keywords:**
- mapping, land use

**Abstract:**
Land Use and Land Cover (LULC) data consists of historical land use and land cover classification data based primarily on the manual interpretation of 1970s and 1980s aerial photography. Along with the LULC files, associated maps are included which provide additional information on political units, hydrologic units, census county subdivisions, and Federal and State land ownership. LULC data is available for the conterminous U.S. and Hawaii, but coverage is not complete for all areas. LULC data and maps are available to the public at no charge.

**Keywords:** legislation, NFIP, public policy, repetitive losses

**Abstract:** The purpose of the legislation is to amend the National Flood Insurance Program Act of 1968 to focus on reducing claim payments to repetitive loss properties. The legislation inserts the objective of reducing repetitive loss claims into nearly every aspect of the NFIP. For instance, the legislation prioritizes mitigation grants to repetitive loss properties. Post-FIRM properties, repetitive claim payment properties, and certain leased coastal and river properties are included in the structures that should be charged an actuarial rate for flood insurance. Repetitive claim payment properties are also exempted from limitations on annual premium increases. The legislation withholds federal disaster assistance for properties to which repetitive flood insurance claim payments have been made. However, funding for mitigation activities may be provided if it is found to be in the best interest of the NFIP. Similar versions of the legislation were presented to the 107th and 108th Congress.

Available at: [http://commdocs.house.gov/committees/bank/hba89082.000/hba89082_0.htm](http://commdocs.house.gov/committees/bank/hba89082.000/hba89082_0.htm)

**Keywords:** legislation, NFIP, repetitive losses

**Abstract:** The hearings address the one-year reauthorization of the NFIP. The hearing focus on the problem of repetitive loss properties and contain testimony from congressmen and representatives of FEMA, ASFPM, and insurance and banking associations. FEMA has identified over 48,000 properties currently insured under the NFIP as repetitive loss properties. They cost the program approximately $200 million annually and are found in nearly every state. It should be noted that presenters defined repetitive loss properties with slightly different criteria. For instance, one of the congressmen defines repetitive loss properties as those properties that have been flooded twice or more since 1978 with each claim exceeding $1,000. Another defines them as properties that have been flooded twice or more in a ten-year period with each claim exceeding $1,000. The proposals generally provide enabling legislation for FEMA to mitigate repetitive loss properties or impose consequences for those who refuse mitigation, such as increasing insurance premiums or refusing insurance.

**Keywords:** disaster assistance, federal programs, history, insurance industry, public assistance

**Abstract:** This report chronicles the history of federal disaster relief and recovery funding and evaluates the types and amounts of federal financial assistance provided to individuals, state and local governments, and nonprofit organizations. The report contains comprehensive calculations.
of federal expenditures for disaster assistance, low interest loans to individual disaster victims and communities, and federal disaster insurance programs between 1977 and 1993. The report also discusses nonfederal entities – state and local governments, private insurance companies, and nonprofit disaster relief agencies – and their role in disaster relief. Particular attention in the historical analysis is given to the dual challenges produced by exceptionally severe catastrophes in the early 1990s and constraints of the Budget Enforcement Act of 1990, which has intensified debate over disaster-related appropriations. The report outlines three means for meeting budgetary constraints. The first is making more assistance contingent on a presidential declaration of an emergency or major disaster. To accomplish this, the criteria and informational sources for such a declaration must be defined better. Second, the NFIP should emphasize hazard mitigation with incentives for cooperation with private entities. The third approach is to rely more heavily on insurance to “prefund” disasters. The report includes appendices on the evolution of federal disaster assistance policies and programs and profiles of major federal disaster assistance programs.

NOTE: This report reproduces “A Report from the Secretary of the Department of Housing and Urban Development to the President, as required by the Southeast Hurricane Disaster Relief Act of 1965 (P.L. 89-339), 89th Congress, H.R. 11539, November 8, 1965.

**Keywords:**  
history, insurance, legislation, NFIP, public policy  

**Abstract:** In response to a directive of the Hurricane Disaster Relief Act of 1965, a report was compiled to address the need to provide flood insurance or other assistance following floods and other natural disasters. This report describes specific characteristics of floods that require consideration for any proposed program. The report finds that floods are identifiable by specified local areas but unpredictable in terms of timing and magnitude and ultimately inevitable. Any potential flood insurance program should consist of basic elements including accurate assessment of risks, compensation of risk bearers, subsidy of premiums, if publicly desirable, incentives to policyholders to reduce risks, incentives to states and local governments for wise management of flood-prone areas, and continuous appraisals. The four program administrative options include a wholly private system, a private industry program with major federal help, a private industry operating government program, and an all-federal program. Final recommendations of the committee include the establishment of a national flood insurance program with “government assistance or participation to the extent necessary to assure a workable method of pooling risks, minimizing costs and distributing burdens equally among the property owners protected by such insurance and the general taxpayers” in cooperation with state and local governments and private industry. Furthermore, the report recommends modification of the existing federal flood program to meet the necessary elements reviewed by the committee.

**Keywords:**  
insurance industry, legislation, NFIP  

**Abstract:** The report constitutes the Senate Banking Committee’s analysis of proposed legislation S1985, which would create a national program of flood insurance. The report notes
that the increasing financial cost of flood losses has created a need for flood insurance. The proposed flood insurance program would require the government to make payments into a pool of risk capital created by private risk-sharing insurance companies in order to help cover industry losses and to provide reinsurance coverage to the pool in the event of exceptionally high losses. The program would also encourage state and local governments to adopt and enforce provisions that would restrict land development in areas that are particularly prone to flooding.

Keywords: disaster assistance, Small Business Administration
Abstract: SBA’s Office of the Inspector General (OIG) audited declined applications for disaster loans to determine whether the decline rate was higher than necessary due to inappropriate decline decisions. The audit reviewed a random sample of 97 disaster loan applications declined between October 1, 1994, and September 30, 1995. Decisions to decline loan applications were generally appropriate. SBA’s OIG identified only one of 97 declined applications that could have received approval. SBA declined the application because the loan officer decided that available cash was insufficient to service the additional debt. A higher than necessary decline rate occurred because SBA did not consistently apply summary decline procedure to applications that did not meet minimum income and/or repayment ability criteria. Of the 97 declined applications in the sample, SBA could have summarily declined 16 of them without processing. If SBA followed summary decline procedures consistently, the number of applications accepted for processing would have decreased, thereby reducing the decline rate and increasing the percentage of approved applications. Furthermore, SBA unnecessarily incurred costs due to loss verification and increased its processing workload. When SBA summarily declines an application, the loan officer does not have to evaluate creditworthiness or perform detailed analysis on repayment ability. In addition, summary declined applications do not require visits by loss verifiers to determine the extent of property damage. The average costs to verify the loss for an application was about $121. Based on its analysis, SBA’s OIG recommends SBA institute procedures to ensure loan officers follow procedures for summary declines when appropriate.

Keywords: disaster assistance, Small Business Administration
Abstract: SBA’s Office of the Inspector General (OIG) audited the agency’s disaster home loan servicing centers in Birmingham, AL; El Paso, TX; New York, NY; and Santa Ana, CA. As of September 30, 1997, SBA’s portfolio of disaster home loans at the servicing centers consisted of 185,417 loans valued at $3 billion, of which 12,843 loans valued at $179 million were in a past due, delinquent, or in-liquidation status. SBA’s OIG statistically sampled 432 of these loans valued at $4.8 million to determine whether SBA followed collection procedures or performed liquidation actions intended to minimize losses. Collections actions on past due disaster loans were untimely, not done weekly, and continued beyond recommended time limits. Although specific losses cannot be identified, SBA did not maximize collection efforts for outstanding loan balances totaling $79.2 million. Furthermore, the audit reveals that disaster home loans were
charged off (i.e., no reasonable expectation that borrower will repay the loan) without litigation or collection agency referrals. SBA’s OIG estimates that $4.8 million charged off for 928 loans could have been potentially recoverable had the agency used various liquidation tools. Based on its analysis, SBA’s OIG recommends the agency improve collection actions on past due loans, conduct a study on staffing requirements, and use available collection tools to liquidate loans.

environmental impacts, environmental policy, flood causes, floodplain management, nonstructural approaches, public policy, structural approaches

**Abstract:** This handbook summarizes the problem of losses from floods and suggests potential solutions. It is intended to help local officials, public interest groups, and concerned citizens to assess the problems in their area and initiate appropriate and effective management of the floodplain. The handbook treats both riverine and coastal floodplains and describes a full range of structural and nonstructural measures to reduce losses from floods and to maintain the natural values of the floodplain. The handbook provides step-by-step guidance for developing a floodplain management program and identifies the range of technical and financial assistance available for preparing and implementing such programs.

**Keywords:**
beach nourishment, coastal areas, development, repetitive losses

**Abstract:** This editorial frames the series of articles in *USA Today* on the growth of the population on the Atlantic and Gulf Coasts, with the view that federal aid helps drive migration to these areas and taxpayers are left with increasing disaster-relief costs when the weather turns bad. Efforts to reduce subsidies have been met with stiff resistance from lawmakers representing coastal areas. The Clinton Administration’s effort to eliminate disaster relief for beaches was blocked, and FEMA’s effort to get Congress to stop spending money on replacing beaches and dunes was also defeated. FEMA is taking steps to stop rampant abuse of the NFIP. A bill in Congress that would limit property owners to two flood claims has little chance of passing.

**Keywords:**
buyouts, levees, repetitive losses

**Abstract:** National public disaster policy fosters development and reconstruction in areas at high risk of future disaster and fosters a long-term reliance on government. Despite annual expenditures of $4 billion, flood disasters still cause considerable loss of life and property each year. Levees and flood walls, some of the most frequently used methods of flood control, may worsen flood conditions downstream or cause catastrophic damage when they fail. The author also notes that global climate change may lead to even more severe flooding. However, there are
solutions. Buyouts that remove repeatedly flood-damaged properties from flood zones are a permanent solution to flooding and its costs. Voluntary buyouts make the most fiscally responsible use of insurance premium and disaster relief tax dollars and provide real economic benefits.

Keywords: Europe, insurance industry, legislation, natural disasters

Abstract: The paper provides an overview of the way in which damages caused by natural disasters are compensated by private insurance in several European countries. The article provides an overview of legislative rules on private insurance, the various manners in which insurance is offered, and discusses whether the private insurance systems resemble traditional insurance or government compensation. Research found that even in the absence of any specific regulation, in most European countries the danger of flood, earthquake, and landslide can be, and is commonly, insured. Furthermore, the private insurance of damage caused by flood and earthquake is widespread in the United Kingdom, Portugal, Greece, and Germany, compared with other countries studied. However, no European country requires insurance protection against natural disasters and discrete insurance policies for “natural catastrophes,” “earthquakes,” or “floods” are not offered: natural disasters can usually be covered only in either multirisk insurance contracts covering damage to goods, or in a fire insurance contract. The paper recommends further study of the law and practice of disaster insurance in the hopes of creating effective regulation to deal with the costs of natural disasters.

Keywords: flood control, floodplain management, Vermont

Abstract: This report focuses on how Vermont should prepare for floods, prevent flood damage, and clean up after flooding has ended. The NFIP has worked well in the state as little flood damage has occurred to structures built in compliance with local floodplain regulations. However, not all Vermont communities have joined the NFIP and thus, some flood-prone areas do not have flood insurance coverage. The program does well with mapping flood-prone areas adjacent to larger rivers and streams, but it insufficiently accounts for flooding in smaller tributaries and flooding that results from the formation of ice or debris jams. The report recommends a more aggressive application of the FEMA’s 1995 mitigation policy that provides federal funding for building more expensive, but properly designed, replacements for inadequate structures (e.g., undersized culverts, etc.) lost or damaged during floods.

Abstract: Over the past decade flood damage costs have risen dramatically in Vermont, due to the increasing occurrences of flooding. From 1989 to 1997, FEMA allocated over $20 million, administered by the Department of Housing and Community Affairs (DHCA), for assistance to repair public works in Vermont’s municipalities. Recently, a majority of flood damage in the state has occurred along upland streams, damaging private property and infrastructure such as bridges, roads, and culverts. Furthermore, DHCA’s responsibility for assisting municipalities in making responsible land-use decisions depends on an understanding of flood hazards, mapping, mitigation, and management. This guide presents information on flooding and floodplains in Vermont, the NFIP, disaster assistance, mapping, CRS, state and local regulations, and potential impacts of weather and climate change.

Available at: http://desastres.usac.edu.gt/documentos/pdf/eng/doc13164/doc13164.htm

Abstract: The report analyzes formal and informal interactions between the United States and Canada during the 1997 Red River Basin flood, which forced the evacuation of more than 80,000 people from their homes and caused billions of dollars in damages. The Red River Basin is a 45,000 square mile area spanning Manitoba, Canada and North Dakota and Minnesota in the United States. Significant flooding occurs approximately every 10 years. The study used in-depth interviews with key government officials and nongovernmental representatives in both countries. The study found that informal and formal networks of information sharing and cooperation were strong prior to the flood – organizations and governments on both sides of the border interacted routinely – and that this aided in preparation, management, and recovery for the flood. The Manitoba Department of Natural Resources relied on the U.S. Geological Survey and the National Weather Service for data regarding precipitation, soil moisture, snow cover, stream flow, and water level. The city of Winnipeg offered temporary housing to American evacuees. Cross-border agreements, such as the one signed in 1986 that outlines comprehensive civil emergency planning and management assurances, also aided in floodplain management. Informal interactions consisted primarily of telephone calls between border communities to share prediction data or coordinate preparatory and recovery efforts. Following the flood, several transnational organizations were created to assess the threat and provide recommendations to reduce future flooding and prevent harm. The International Red River Task Force developed an informational network of stakeholders who meet regularly and exchange information. The report notes some inconsistencies between organizations that made a coordinated response slightly more difficult, but stops short of recommending international standardization: floodplain management may vary by country and by combination of countries in the case of transnational disasters. Inconsistencies do not necessarily lead to problems in disaster response if organizations are aware of the differences and take adequate steps to prevent problems that may arise from them.

Keywords:
disaster assistance, floodplain management, insurance, Midwest floods of 1993

Abstract: The author comments on the “The Challenge of the Mississippi Flood,” by Myers and White (1993) in Environment. He contends that unless the incentives associated with floodplain management and assistance are modified, the public is doomed to revisit expensive relief efforts as often as disasters occur. The author points out that implicit in much of Myers and White’s article is that, although federal objectives should be different (more focus on nonstructural measures and restoration of wildlife habitat), federal expenditures should play a prominent role. However, if incentives are properly structured, many of these programs would not be federally funded at all. The author claims that “most of the structures and lands affected by last summer’s floods are privately owned, and private insurance should be priced to cover the appropriate level of risk. Forcing the adoption of private insurance would likely spawn entirely new creative approaches to reducing risks.”

Available at: http://www.nwf.org/nationalwildlife/article.cfm?articleId=537&issueId=45

Keywords:
buyouts, environmental restoration, relocation, repetitive losses

Abstract: The author reports that some communities in the United States, after years of repeatedly incurring flood damages and rebuilding houses, are opting to move homeowners to higher ground. He identifies states and communities with repetitive flood-damage claims, and discusses criticisms against the NFIP. The author draws on Higher Ground, a study conducted by the National Wildlife Federation, to contend that restoring floodplains to their natural function helps limit the damage from future floods, while protecting water quality and creating prime space for recreation and wildlife. The author complains that “old habits are dying slowly,” but argues that things are changing. For example, the Army Corps of Engineers recently broke with tradition by announcing plans to promote buyouts and restoration of wetlands.

Keywords:
attitudes, awareness, Colorado, risk communication, risk perception, urban areas

Abstract: This study reports on an examination of various characteristics of residents of flood hazard areas in an effort to determine which factors have the most significance in explaining behavior to mitigate potential hazards. The study endeavors to illuminate a two-level process thought to be relevant to the behavior of mitigation. First, analyses were conducted to determine which characteristics play the most significant role in creating an overall awareness of the flood hazard. Second, analyses identified which factors, including hazard awareness, are likely to produce mitigation. Demographic, perceptual, experiential, and knowledge parameters were examined through telephone interviews administered to 249 residents of two similar floodplains in Denver’s metropolitan area. The analyses indicate that five characteristics have significant association with variation in hazard awareness: 1) prior experience with hazards; 2) previous damage from flooding; 3) respondent’s age (with the younger respondents being more aware); 4) respondent’s tenure at his or her present address (the longer, the more aware); and 5) the
proximity of residence to the creek (the closer, the more aware). The analyses of mitigation behavior identified three major variables, which are important for motivating mitigation action. These include: 1) a general concern about the possibility of flooding, 2) knowledge that the creek had previously flooded, and 3) owning as opposed to renting a home. The analyses also generally showed that respondents who have taken action are older, have lived at their present address longer, live closer to the creek, have greater awareness of hazards, and have previous experience with hazards.

**Keywords:** building codes, environmental impacts, Tennessee Valley Authority, zoning

**Abstract:** This report addresses the increase in flood damages and the continued development of floodplain lands. Land-use regulations in floodplains are present in most states, but insufficient to fully address the costs of flood damage and prevent future development. Enabling legislation for local governments limits their regulatory authority to municipal boundaries, while most development occurs in unincorporated or fringe areas. The report examines the potential for zoning ordinances, subdivision regulations, building and housing codes and encroachment line statutes to regulate floodplain development. The report concludes that different land-use regulation tools are suitable for different communities and should be applied locally. State and regional authorities, such as the Tennessee Valley Authority and the Delaware River Basin Commission, can collect data and share best practice information.

**Keywords:** development, disaster planning, floodplain designation, strategic planning, Wales,

**Abstract:** The Technical Advisory Note provides technical assistance to supplement policy described in Planning Policy Wales in relation to development and flooding. The document incorporates sustainability principles and provides a framework for assessing riverine, coastal, and runoff flooding. The guidance prefers to direct new development away from floodprone areas. Where development must be considered, the guidance provides a series of building practices to provide adequate flood protection. The plan places the burden on developers to provide documentation and assurance that adequate flood protection is provided. The guidance provides a ranking system for land zones – based on such factors as risk of flooding – but also a ranking system for development –emergency services, highly vulnerable development, and less vulnerable development. The document includes an appendix on assessing flood consequences.

**Keywords:** economic impacts, economic modeling, Florida, Hurricane Andrew, natural disasters

**Abstract:** Two common features of natural disasters are intense regional impact and the call immediately after the event to estimate the economic impact of recovery and reconstruction. The
broad purpose of this paper is to help fill the gap in the regional science literature that addresses this issue. Initially, the impact estimation problem is presented conceptually. Using a general regional model, direct disaster impacts on exogenous variables, endogenous variables, and model linkages are identified. The conceptual problem is adapted for practical application. This translation has two aspects: (a) modifying the direct impacts for a specific model (common variants from the schematic are considered) and (b) estimating those impacts from available data. One component of the latter identifies primary sources of information typically available at the time of a natural disaster and indicates how secondary data may be used to complement, cross-check, and expand those data. A second component identifies areas of no information or high uncertainty and discusses treatment of that information gap in empirical analysis. A final section applies the research to the problem of estimating the impact of Hurricane Andrew on Florida’s economy.

**Keywords:** cost-benefit analysis, structural approaches, zoning

**Abstract:** This article compares floodplain zoning against structural flood control. The author observes that optimization of investment between these alternatives requires consideration of project-induced development (economic development that would not occur if the project were not built) and site income (the return to the owner of new construction in the floodplain net of the cost of development). According to the author, previously existing methods that do not account for damages to project-induced growth may give unduly high cost-benefit ratios. A combination of flood control and zoning is expected to be the most productive scenario.

**Keywords:** disaster assistance, federal programs, insurance, Midwest floods of 1993, mitigation

**Abstract:** In order to avoid a repetition of the Midwest floods of 1993 or in other regions of the nation, positive action will have to be taken on at least five major issues. First, the operating policies of federal agencies must be coordinated with each other and with the integrating role on the ground of appropriate state agencies. Second, the present policies of providing federal disaster relief will need to be revised to emphasize mitigation. Third, government and private insurance against flood losses must be offered in a more coherent fashion. Fourth, the prosecution of federal and cooperative programs for management of the floodplains and watersheds must be planned upon the basis of integrated criteria and studies that take account of the natural values of wetlands and floodplains. Finally, more discerning and continuing executive and legislative audits of how well policy directives are translated into action are needed.

**Keywords:**
environmental policy, public policy, Unified National Program

**Abstract:** The author presents criteria that he believes would, if applied, lead to the selection of high-priority goals for achieving wise management of water resources. He states that the science and technology community needs to address systematically, and with increasing intensity, at least four deficiencies in water and related environmental management. First, there is a need to fully recognize the complex social aims that are inherent in managing any one resource or combination of resources. While public policy is slowly coming to take account of the many social and environmental relationships, it still largely ignores some of them, particularly at the intersection of social and environmental systems. Second, the criteria used to evaluate those relationships are frequently narrow, and while measures such as flood damage reduction of the magnitude of communicable diseases are used, they do not reflect other important costs and benefits needed to guide public policy. Third, notwithstanding continued interest in comprehensive river basin planning and watershed studies, there is still no widely accepted national framework for planning and carrying out such studies in suitably delimited areas with responsible participation by representatives of a full range of concerned stakeholders, including citizens and local, state, and national agencies. Fourth, even after a century of vigorous and promising activity in the study and management of human interactions with water and other elements of the environment, the United States still lacks a program to appraise the results of such efforts rigorously in the lives of people and ecosystems. Severe problems of social organization and process stand in the way of achieving such improvements in each segment of water management. In each there is need for imaginative research to extend the limiting conditions of both organization and knowledge. The time is ripe for a unified effort.

**Keywords:**
disaster planning, natural disasters, risk assessment

**Abstract:** This book focuses on natural hazards. It summarizes research on natural disasters in the United States, discusses future disasters, the nation’s response to extreme geophysical events, acceptable levels of risk, adjustment choices, possible improvements, application of research, methods of estimating research results, common adjustment research themes, new research strategies, and last, hazards and their distinctive opportunities.

**Keywords:**
environmental protection, environmental restoration, federal programs, wetlands

**Abstract:** The positions contained in this paper strongly support the effective protection and restoration of the nation’s wetlands, while advocating much-needed reforms to increase the fairness and flexibility of federal regulatory programs. The Clinton Administration supports the interim goal of no overall net loss of the nation’s remaining wetlands and the long-term goal of increasing the quality and quantity of the nation’s resource base from wetlands. Additional principles for federal wetlands policy are proposed: (a) regulatory programs should be fair,
flexible, and predictable and should be administered in a way that avoids unnecessary impacts on private property and the regulated public; (b) non-regulatory programs should be encouraged; (c) federal partnerships with state, tribal, and local governments, the private sector, and individual citizens should be expanded and should approach wetlands protection and restoration from the context of an ecosystem/watershed; and (d) federal policy on wetlands should be based on the best scientific information available.

**Keywords:** hydrology and hydraulics, modeling, riverine areas

**Abstract:** This book documents the proceedings of the International Conference on River Flood Hydraulics in Wallingford, England. The purpose of the conference was to promulgate new ideas and to bring together international experts in the field. The aim of the conference was to link current experimental and analytical research to the needs of engineering practice. The topics selected for the conference covered areas of international research interest and practical importance with a view to providing a forum for advancing the art of river engineering. The major topics covered by the conference were: (a) flood analysis and prediction; (b) field data; (c) hydraulics of flood flows; (d) sediment transport and morphological effects; (e) physical and numerical modeling; and (f) engineering design, maintenance, and operation of schemes.

**Keywords:** coastal areas, Coastal Barrier Resources Act, legislation

**Abstract:** Coastal development is influenced in part by incentives – actual and perceived – resulting from federal government actions. The report examines two current efforts by the NFIP to address those incentives: the National Flood Insurance Reform Act of 1994 and coordination of the NFIP with the Coastal Barrier Resources Act (CBRA). The National Flood Insurance Reform Act of 1994 recommended studies of communities subject to coastal erosion, to result in an economic impact analysis that would assess the costs and benefits of mapping, regulating, and insuring them. The studies will also determine the effect of such regulation and insurance on property values, tax revenues, employment, economic development, and the need for future federal and state disaster assistance. Five million dollars was authorized for mapping erosion hazards in a representative sample of at-risk communities throughout the United States, including coastal, Great Lakes, and riverine areas. Early versions of the legislation had proposed curtailing federally provided flood insurance in coastal erosion zones, but those provisions were scrapped in the face of opposition from coastal communities. The author notes, however, that the new law strengthens enforcement of the mandatory purchase requirement and lengthens the waiting period from 5 to 30 days for coverage to become effective after purchase. CBRA relies on NFIP-provided disincentives to discourage building in vulnerable coastal areas, by prohibiting the sale of flood insurance in designated CBRA. The financial risk is transferred from federal...
taxpayers to those who choose to live or invest in CBRA areas. Some critics contend that the federal government has not established strong enough disincentives for coastal construction and that additional legislation such as national minimum erosion setback requirements is needed.

**Keywords**: awareness, floodplain management, mapping, risk assessment

**Abstract**: This report proposes achieving community awareness-development through a state-by-state database to coordinate flood hazard information to facilitate dissemination of that information. The NFIP was created to mitigate future flood losses and to provide protection for property owners from potential losses. As a risk assessment and mapping program, the NFIP has generated and used data to develop actuarial flood insurance rates and local floodplain management programs. Technological advances in the field of computer science have facilitated the cost-effective accumulation, manipulation, and transfer of database information and the production of reports by noncomputer-literate people. An inventory of Letters of Map Amendment and Letters of Map Revision was prepared based on fill, which is an example of the type of information that could be included in the comprehensive database. The inventory was developed as FEMA investigated information that could be merged into a digital system of street addresses. In the future, additional mechanisms will be developed for identifying, compiling, and disseminating available flood-hazard-related information that will be included in the proposed comprehensive database of flood hazard information from federal, state, and local sources. At the discretion of FEMA, the databases will be compiled in the following order: (a) Letters of Map Revision not based on fill; (b) physical map revisions; and (c) flood insurance studies.

**Keywords**: flood damage, Meuse River, modeling

**Abstract**: This paper addresses uncertainties pertaining to damage assessments made for the flooding of the Meuse River in 1993 and 1995. The analysis is based on flood damage data that were collected by damage experts and consist of large sample sizes within each municipality. The most interesting aspect of these two floods is that although the volume of flooding and the inundated area were comparable in order of magnitude, the flood damage estimates in 1995 were 35 percent lower than in 1993. The authors concluded that part of the reduction in flood damage during the 1995 flood was due to a reduction in the damage to household goods. This may be explained by a marginal increase in flood warning time and experiences gained from the flood of 1993. As flood damage assessments are the cornerstone in the evaluation of mitigation schemes, empirical data of previous floods should be used to improve the foundations of the methods to assess flood damages.

Keywords: 
floodplain management, Wisconsin

Abstract: This report analyzes the contribution of local programs to the overall goals and objectives of Wisconsin’s floodplain management programs using a community-based data system. The Wisconsin Department of Natural Resources conducts community floodplain audits to collect data onsite. Auditors perform field inspections and review zoning ordinances and program files with local program administrators. The authors conclude that program priorities ought to be expanded beyond zoning to include activities aimed at mitigating existing flood hazards prior to flood disasters. Also, local program monitoring and community assistance and education were deemed essential to the success of the program. This goal could be accomplished by more clearly defined objectives and definitions at the state level and more intensive follow-up and data collection efforts by the state agency.

Keywords: 
insurance industry, Wales

Abstract: The paper presents the findings of a questionnaire of surveyors and a case study of a flood disaster in Rossett, North Wales. The survey found that surveyors are generally not concerned with flooding, and the issue has little presence in the profession. There is no generally recognized framework for the individual assessment of risk, with negative effects for insurability and repair strategies. The report proposes that the Royal Institute of Chartered Surveyors (RICS) Foundation develop guidance for surveyors in the form of a checklist procedure using approved information sources, and a structured on-site survey. The degree of damage in a particular instance is the product of the severity of the flood, the building’s construction, and the preparedness of property owners. The case study of the flood disaster in Rossett in 2001 found that responses to the flood were varied and uncoordinated.

Keywords: 
floodplain management, history, strategic planning

Abstract: This article describes the evolution of approaches to floodplain management in the United States. The evolution has come from the gradual merger of three policy streams—flood control, resources protection, and disaster assistance—and it includes a shifting of responsibility from the state and local level to the federal level. Recent accomplishments include the employment of new approaches and programs to deal with flood problems, the emergence of the NFIP as the dominant federal activity for dealing with floods, and growing public awareness. The author recommends six general areas for improvement in the future: (a) achieve a proper accounting of flood risk in decision making, (b) investigate flood loss reduction and resource protection strategies further, (c) build floodplain management capability at all government levels,
(d) achieve the intent of the NFIP, (e) avoid political responses to flood disasters, and (f) employ new approaches.

**Keywords**: history, legislation

**Abstract**: This report explores the forces and events that have shaped floodplain management policy and practice. It begins in the early nineteenth century, with the debates about federal involvement in flood control and then documents the Flood Control Acts of 1917, 1928, and 1936, which demonstrate an increasing federal role in flood control. As the nation became more urbanized, the potential for flood damage increased faster than it could be controlled, and a broader approach to the problem became necessary. The Tennessee Valley Authority, Army Corps of Engineers, U.S. Geological Survey, and several states all played roles in establishing regulations for floodplain management. In 1968 Congress established the NFIP, and with it began, among other things, national floodplain mapping, stricter land-use regulations, buyout programs, and the privatization of some flood insurance policies. In 1987 the Federal Interagency Floodplain Management Task Force initiated an assessment of the nation’s program for floodplain management. The assessment was completed in 1992 with the publication of a two-volume report, *Floodplain Management in the United States: An Assessment Report*, and based on the report, the Task Force developed a revised Unified National Program for Floodplain Management in 1993 to reflect trends affecting floodplain management, and to include findings in the 1992 assessment. Many observers in the 1990s believed even more changes in national policies were necessary, as well as public awareness of the risks of living in flood-prone areas.

**Keywords**: agency operations and management, climate change, development, flood causes, flood control, mitigation, risk management, Scotland, structural approaches, urban areas

**Abstract**: This article finds that flood risk is increasing in Scotland due to a variety of factors, including climate change and urban development. Because different organizations are charged with managing flood risk, there is no comprehensive or coordinated approach to flood abatement and prevention. The report proposes that floodplain management professionals pursue sustainable flood management principles that incorporate measures for equally protecting all communities against flooding through appropriate floodwater storage and movement.

**Keywords**: modeling, riverine areas

**Abstract**: Let \( \{Y_j\} \) represent periodically sampled river discharge values. For simplicity, a flood occurs at epoch \( n+1 \) if, for some fixed \( T \), \( Y_{n+1} > T \). Assume that at epoch \( n \), the decision maker must decide whether or not to issue a flood warning, this decision being based on the past flow
record \{Y_i\} j< n. Finally, assume that costs have been assigned to the two types of mistakes: the “false alarm” event and the event that a flood occurs when no warning was issued. It is argued that outside the Gaussian assumption, standard time series methodology is inappropriate for the flood-warning problem. This paper relates recent progress based on alternate principles. A nonparametric inference procedure is described that converges to the optimal decision function for the flood warning problem as the length of the historical record increases for any stationary G2-ergodic Markov process. Under additional assumptions, rates can be established and shown to be optimal in a certain sense. The new methodology is compared with autoregressive moving average predictors on simulated and actual river flow data.

**Keywords:**
coastal areas, development, insurance, NFIP, Texas

**Abstract:** Texas is a flood-prone state. On average, a hurricane or storm will strike the Texas coast every 2.6 years, causing significant property damage and numerous lives lost. The Gulf of Mexico areas are experiencing considerable development despite the damage caused by hurricanes and floods. FEMA estimates that 675,000 Texas households reside in the 1 percent annual chance floodplain, most in coastal areas. Following hurricanes, most damaged structures are rebuilt in their original location, even if the damage to the property was more than half of the total value of the property. In addition, buildings are increasingly being constructed along the coast. Some argue that the rate and pattern of beachfront development has been shaped by “fundamental” economic factors, implying the coastal development cannot be deterred. Others insist that the availability of flood insurance might have been a major factor in encouraging shoreline development since the inception of the NFIP in 1968. For the analysis, series of historical aerial photographs from 1958 to 2002 were obtained for Jamaica beach on Galveston Island in Galveston county and Surfside Beach on Follets Island of Brazoria County, Texas. By analyzing and comparing these remote sensing data, this research examines how exposure to flood hazards and the availability of federal flood insurance affects the pattern of development in the Gulf of Mexico area.

**Keywords:**
Australia, awareness, communication, housing markets, liability, property values, risk communication

**Abstract:** Floodplain mapping is an essential activity for sensible floodplain management. Floodplain mapping incorporates land-use planning, warning systems, and public education. However, disclosure of flood risk information has led to opposition from those who perceive that such disclosure may reduce property values. The study finds that evidence of the effects of disclosure of flood liability on residential property values is mixed. The paper explores how
public disclosure of flood liability affects property values by examining research done internationally on this subject, and applying that research to conditions in Australia. Studies from the United States determined that flood-liable properties are valued between 4 and 12 percent less than comparable properties outside of flood zones. Studies in Canada and New Zealand have found no distinction in property values between structures in SFHAs and non-SFHAs. In conclusion, the study determines that the balance of evidence suggests that the grounds for refusing disclosure are weak. The article notes that overall, slightly more research indicates that disclosure has no significant impact on property value, and that the advantages of flood liability disclosure outweigh the potential drawbacks.

**Keywords:** alluvial fans, Arizona, hydrology and hydraulics, modeling, 1 percent annual chance flood standard, risk assessment

**Abstract:** Alluvial fans along mountain bases pose quite interesting problems for the design of hydraulic structures and highway crossings and for flood insurance studies. FEMA’s alluvial fan method is subject to uncertainties because it is an approximate method. In this paper, Rosenblueth’s point-estimate is applied to the alluvial fan method to compute the mean and standard deviation for the 1 percent annual chance flood discharge at any point on the fan and the mean and standard deviation for the width of the fan area. The mean and standard deviation for the 1 percent annual chance flood discharge are used to obtain the risk that the 1 percent annual chance flood discharge will exceed the discharge capacity of hydraulic structures on the fan. The mean and standard deviation for the width of the fan area are used to estimate the risk that a given location on the fan will be within the hazard flood zone. The HEC-1 rainfall-runoff computer model is used to compute inputs to the FEMA method. The proposed uncertainty and risk analyses are applied to an alluvial fan in north Scottsdale, AZ.

**Keywords:** development, economic modeling, New Jersey, property values

**Abstract:** The persistence of development and settlement in floodplains and continued damages from flooding, raises the question of how property owners respond to floodplain location and whether property values reflect this response. Existing studies disagree on the significance of flood hazard for property values. This study evaluates the effect of floodplain location on assessed valuation and home value in three towns in New Jersey. A t-test on mean assessed value and value of owner-occupied units at block levels showed no statistically significant variation for flood-prone and nonflood-prone lands. Possible explanations are that homeowners do not know or perceive the risk of living in floodplains, assessors do not incorporate flooding into assessment criteria, and flood insurance and broadened financial markets may equalize property values.
